5.3.11 Radio link failure related actions

5.3.11.1 General

5.3.11.2 Initiation

5.3.11.3 Reception of the Paging message by the UE

5.3.11.4 RRC connection establishment

5.3.11.5 General

5.3.11.6 Initiation

5.3.11.7 Actions related to transmission of RRCConnectionSetup message

5.3.11.8 Reception of the RRCConnectionSetup by the UE

5.3.11.9 Cell re-selection while T300, T302, T303 or T305 is running

5.3.11.10 T300 expiry

5.3.11.11 T302, T303 or T305 expiry or stop

5.3.11.12 Reception of the RRCConnectionReject by the UE

5.3.11.13 Abortion of RRC connection establishment

5.3.11.14 Handling of SSAC related parameters

5.3.11.15 Initial security activation

5.3.11.16 General

5.3.11.17 Initiation

5.3.11.18 Reception of the SecurityModeCommand by the UE

5.3.11.19 RRC connection reconfiguration

5.3.11.20 General

5.3.11.21 Initiation

5.3.11.22 Reception of an RRCConnectionReconfiguration not including the mobilityControlInfo by the UE

5.3.11.23 Reception of an RRCConnectionReconfiguration including the mobilityControlInfo by the UE (handover)

5.3.11.24 Reconfiguration failure

5.3.11.25 T304 expiry (handover failure)

5.3.11.26 Void

5.3.11.27 Radio Resource Configuration involving full configuration option

5.3.11.28 Counter check

5.3.11.29 General

5.3.11.30 Initiation

5.3.11.31 Reception of the CounterCheck message by the UE

5.3.11.32 RRC connection re-establishment

5.3.11.33 General

5.3.11.34 Initiation

5.3.11.35 Actions following cell selection while T311 is running

5.3.11.36 Actions related to transmission of RRCConnectionReestablishmentRequest message

5.3.11.37 Reception of the RRCConnectionReestablishment by the UE

5.3.11.38 T311 expiry

5.3.11.39 T301 expiry or selected cell no longer suitable

5.3.11.40 Reception of RRCConnectionReestablishmentReject by the UE

5.3.11.41 RRC connection release

5.3.11.42 General

5.3.11.43 Initiation

5.3.11.44 Reception of the RRCConnectionRelease by the UE

5.3.11.45 T320 expiry

5.3.11.46 RRC connection release requested by upper layers

5.3.11.47 General

5.3.11.48 Initiation

5.3.11.49 Radio resource configuration

5.3.11.50 General

5.3.11.51 SRB addition/ modification

5.3.11.52 DRB release

5.3.11.53 DRB addition/ modification

5.3.11.54 MAC main reconfiguration

5.3.11.55 Semi-persistent scheduling reconfiguration

5.3.11.56 Physical channel reconfiguration

5.3.11.57 Radio Link Failure Timers and Constants reconfiguration

5.3.11.58 Radio link failure related actions

5.3.11.59 Detection of physical layer problems in RRC_CONNECTED

5.3.11.60 Recovery of physical layer problems
5.3.11.3 Detection of radio link failure ........................................... 55
5.3.12 UE actions upon leaving RRC_CONNECTED .......................... 55
5.3.13 UE actions upon PUCCH/ SRS release request ..................... 56

A.3.6 Fields with conditional presence .............................................................................. 231
A.3.7 Guidelines on use of lists with elements of SEQUENCE type .................................. 232
A.4 Extension of the PDU specifications ............................................................................ 232
### A.4.1 General principles to ensure compatibility

### A.4.2 Critical extension of messages

### A.4.3 Non-critical extension of messages

### A.4.3.1 General principles

### A.4.3.2 Further guidelines

### A.4.3.3 Typical example of evolution of IE with local extensions

### A.4.3.4 Typical examples of non critical extension at the end of a message

### A.4.3.5 Examples of non-critical extensions not placed at the default extension location

- **ParentIE-WithEM**
- **ChildIE1-WithoutEM**
- **ChildIE2-WithoutEM**

### A.5 Guidelines regarding inclusion of transaction identifiers in RRC messages

### A.6 Protection of RRC messages (informative)

### A.7 Miscellaneous

### Annex B (normative): Release 8 AS feature handling

### B.1 Feature group indicators

### B.2 CSG support

### Annex C (informative): Change history
Foreword

This Technical Specification has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- **x**  the first digit:
  - 1  presented to TSG for information;
  - 2  presented to TSG for approval;
  - 3  or greater indicates TSG approved document under change control.

- **y**  the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.

- **z**  the third digit is incremented when editorial only changes have been incorporated in the document.
1 Scope

The present document specifies the Radio Resource Control protocol for the UE-E-UTRAN radio interface.

The scope of the present document also includes:

- the radio related information transported in a transparent container between source eNB and target eNB upon inter eNB handover;
- the radio related information transported in a transparent container between a source or target eNB and another system upon inter RAT handover.

2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document in the same Release as the present document.

3 Definitions, symbols and abbreviations

3.1 Definitions

For the purposes of the present document, the terms and definitions given in TR 21.905 [1] and the following apply. A term defined in the present document takes precedence over the definition of the same term, if any, in TR 21.905 [1].

Information element: A structural element containing a single or multiple fields is referred as information element.

Field: The individual contents of an information element are referred as fields.

Floor: Mathematical function used to 'round down' i.e. to the nearest integer having a lower value.

3.2 Abbreviations

For the purposes of the present document, the abbreviations given in TR 21.905 [1] and the following apply. An abbreviation defined in the present document takes precedence over the definition of the same abbreviation, if any, in TR 21.905 [1].

4 General

4.1 Introduction

This specification is organised as follows:

- sub-clause 4.2 describes the RRC protocol model;
- sub-clause 4.3 specifies the services provided to upper layers as well as the services expected from lower layers;
- sub-clause 4.4 lists the RRC functions;
- clause 5 specifies RRC procedures, including UE state transitions;
- clause 6 specifies the RRC message in a mixed format (i.e. tabular & ASN.1 together);
- clause 7 specifies the variables (including protocol timers and constants) and counters to be used by the UE;
- clause 8 specifies the encoding of the RRC messages;
- clause 9 specifies the specified and default radio configurations;
- clause 10 specifies the RRC messages transferred across network nodes;
- clause 11 specifies the UE capability related constraints and performance requirements.

4.2 Architecture

4.2.1 UE states and state transitions including inter RAT

A UE is in RRC_CONNECTED when an RRC connection has been established. If this is not the case, i.e. no RRC connection is established, the UE is in RRC_IDLE state. The RRC states can further be characterised as follows:

- **RRC_IDLE:**
  - A UE specific DRX may be configured by upper layers.
  - UE controlled mobility;
  - The UE:
    - Monitors a Paging channel to detect incoming calls, system information change, for ETWS capable UEs, ETWS notification, and for CMAS capable UEs, CMAS notification;
- Performs neighbouring cell measurements and cell (re-)selection;
- Acquires system information.

**RRC_CONNECTED:**
- Transfer of unicast data to/from UE.
- At lower layers, the UE may be configured with a UE specific DRX.
- Network controlled mobility, i.e. handover and cell change order with optional network assistance (NACC) to GERAN;
- The UE:
  - Monitors a Paging channel and/or System Information Block Type 1 contents to detect system information change, for ETWS capable UEs, ETWS notification, and for CMAS capable UEs, CMAS notification;
  - Monitors control channels associated with the shared data channel to determine if data is scheduled for it;
  - Provides channel quality and feedback information;
  - Performs neighbouring cell measurements and measurement reporting;
  - Acquires system information.

The following figure not only provides an overview of the RRC states in E-UTRA, but also illustrates the mobility support between E-UTRAN, UTRAN and GERAN.

![Figure 4.2.1-1: E-UTRA states and inter RAT mobility procedures, 3GPP](image-url)

The following figure illustrates the mobility support between E-UTRAN, CDMA2000 1xRTT and CDMA2000 HRPD. The details of the CDMA2000 state models are out of the scope of this specification.
The inter-RAT handover procedure(s) supports the case of signalling, conversational services, non-conversational services and combinations of these.

In addition to the state transitions shown in Figure 4.2.1-1 and Figure 4.2.1-2, there is support for connection release with redirection information from E-UTRA RRC_CONNECTED to GERAN, UTRAN and CDMA2000 (HRPD Idle/1xRTT Dormant mode).

4.2.2 Signalling radio bearers

"Signalling Radio Bearers" (SRBs) are defined as Radio Bearers (RB) that are used only for the transmission of RRC and NAS messages. More specifically, the following three SRBs are defined:

- SRB0 is for RRC messages using the CCCH logical channel;
- SRB1 is for RRC messages (which may include a piggybacked NAS message) as well as for NAS messages prior to the establishment of SRB2, all using DCCH logical channel;
- SRB2 is for NAS messages, using DCCH logical channel. SRB2 has a lower-priority than SRB1 and is always configured by E-UTRAN after security activation.

In downlink piggybacking of NAS messages is used only for one dependant (i.e. with joint success/failure) procedure: bearer establishment/modification/release. In uplink NAS message piggybacking is used only for transferring the initial NAS message during connection setup.

NOTE: The NAS messages transferred via SRB2 are also contained in RRC messages, which however do not include any RRC protocol control information.

Once security is activated, all RRC messages on SRB1 and SRB2, including those containing NAS or non-3GPP messages, are integrity protected and ciphered by PDCP. NAS independently applies integrity protection and ciphering to the NAS messages.
4.3 Services

4.3.1 Services provided to upper layers

The RRC protocol offers the following services to upper layers:

- Broadcast of common control information;
- Notification of UEs in RRC_IDLE, e.g. about a terminating call, for ETWS, for CMAS;
- Transfer of dedicated control information, i.e. information for one specific UE.

4.3.2 Services expected from lower layers

In brief, the following are the main services that RRC expects from lower layers:

- PDCP: integrity protection and ciphering;
- RLC: reliable and in-sequence transfer of information, without introducing duplicates and with support for segmentation and concatenation.

Further details about the services provided by Packet Data Convergence Protocol layer (e.g. integrity and ciphering) are provided in TS 36.323 [8]. The services provided by Radio Link Control layer (e.g. the RLC modes) are specified in TS 36.322 [7]. Further details about the services provided by Medium Access Control layer (e.g. the logical channels) are provided in TS 36.321 [6]. The services provided by physical layer (e.g. the transport channels) are specified in TS 36.302 [3].

4.4 Functions

The RRC protocol includes the following main functions:

- Broadcast of system information:
  - Including NAS common information;
  - Information applicable for UEs in RRC_IDLE, e.g. cell (re-)selection parameters, neighbouring cell information and information (also) applicable for UEs in RRC_CONNECTED, e.g. common channel configuration information.
  - Including ETWS notification, CMAS notification;
- RRC connection control:
  - Paging;
  - Establishment/ modification/ release of RRC connection, including e.g. assignment/ modification of UE identity (C-RNTI), establishment/ modification/ release of SRB1 and SRB2, access class barring;
  - Initial security activation, i.e. initial configuration of AS integrity protection (SRBs) and AS ciphering (SRBs, DRBs);
  - RRC connection mobility including e.g. intra-frequency and inter-frequency handover, associated security handling, i.e. key/ algorithm change, specification of RRC context information transferred between network nodes;
  - Establishment/ modification/ release of RBs carrying user data (DRBs);
  - Radio configuration control including e.g. assignment/ modification of ARQ configuration, HARQ configuration, DRX configuration;
  - QoS control including assignment/ modification of semi-persistent scheduling (SPS) configuration information for DL and UL, assignment/ modification of parameters for UL rate control in the UE, i.e. allocation of a priority and a prioritised bit rate (PBR) for each RB;
- Recovery from radio link failure;
- Inter-RAT mobility including e.g. security activation, transfer of RRC context information;
- Measurement configuration and reporting:
  - Establishment/ modification/ release of measurements (e.g. intra-frequency, inter-frequency and inter-RAT measurements);
  - Setup and release of measurement gaps;
  - Measurement reporting;
- Other functions including e.g. transfer of dedicated NAS information and non-3GPP dedicated information, transfer of UE radio access capability information, support for E-UTRAN sharing (multiple PLMN identities);
- Generic protocol error handling;
- Support of self-configuration and self-optimisation;

NOTE: Random access is specified entirely in the MAC including initial transmission power estimation.

5 Procedures

5.1 General

5.1.1 Introduction

The procedural requirements are structured according to the main functional areas: system information (5.2), connection control (5.3), inter-RAT mobility (5.4) and measurements (5.5). In addition there is a sub-clause other (5.6) that covers e.g. NAS dedicated information transfer, UE capability transfer. Finally, sub-clause 5.7 specifies the generic error handling.

5.1.2 General requirements

The UE shall:

1> process the received messages in order of reception by RRC, i.e. the processing of a message shall be completed before starting the processing of a subsequent message;

NOTE 1: E-UTRAN may initiate a subsequent procedure prior to receiving the UE’s response of a previously initiated procedure.

1> within a sub-clause execute the steps according to the order specified in the procedural description;

1> set the rrc-TransactionIdentifier in the response message, if included, to the same value as included in the message received from E-UTRAN that triggered the response message;

1> upon receiving a choice value set to 'setup':

2> apply the corresponding received configuration and start using the associated resources, unless explicitly specified otherwise;

1> upon receiving a choice value set to 'release':

2> clear the corresponding configuration and stop using the associated resources;

1> upon handover to E-UTRA; or

1> upon receiving an RRCConnectionReconfiguration message including the fullConfig:
apply the Conditions in the ASN.1 for inclusion of the fields for the DRB/PDCP/RLC setup during the reconfiguration of the DRBs included in the \textit{drb-ToAddModList};

NOTE 2: At each point in time, the UE keeps a single value for each field except for during handover when the UE temporarily stores the previous configuration so it can revert back upon handover failure. In other words: when the UE reconfigures a field, the existing value is released except for during handover.

NOTE 3: Although not explicitly stated, the UE initially considers all functionality to be deactivated/released until it is explicitly stated that the functionality is setup/activated. Correspondingly, the UE initially considers lists to be empty e.g. the list of radio bearers, the list of measurements.

5.2 System information

5.2.1 Introduction

5.2.1.1 General

System information is divided into the \textit{MasterInformationBlock} (MIB) and a number of \textit{SystemInformationBlocks} (SIBs). The MIB includes a limited number of most essential and most frequently transmitted parameters that are needed to acquire other information from the cell, and is transmitted on BCH. SIBs other than \textit{SystemInformationBlockType1} are carried in \textit{SystemInformation} (SI) messages and mapping of SIBs to SI messages is flexibly configurable by \textit{schedulingInfoList} included in \textit{SystemInformationBlockType1}, with restrictions that: each SIB is contained only in a single SI message, only SIBs having the same scheduling requirement (periodicity) can be mapped to the same SI message, and \textit{SystemInformationBlockType2} is always mapped to the SI message that corresponds to the first entry in the list of SI messages in \textit{schedulingInfoList}. There may be multiple SI messages transmitted with the same periodicity. \textit{SystemInformationBlockType1} and all SI messages are transmitted on DL-SCH.

5.2.1.2 Scheduling

The MIB uses a fixed schedule with a periodicity of 40 ms and repetitions made within 40 ms. The first transmission of the MIB is scheduled in subframe #0 of radio frames for which the SFN mod 4 = 0, and repetitions are scheduled in subframe #0 of all other radio frames.

The \textit{SystemInformationBlockType1} uses a fixed schedule with a periodicity of 80 ms and repetitions made within 80 ms. The first transmission of \textit{SystemInformationBlockType1} is scheduled in subframe #5 of radio frames for which the SFN mod 8 = 0, and repetitions are scheduled in subframe #5 of all other radio frames for which SFN mod 2 = 0.

The SI messages are transmitted within periodically occurring time domain windows (referred to as SI-windows) using dynamic scheduling. Each SI message is associated with a SI-window and the SI-windows of different SI messages do not overlap. That is, within one SI-window only the corresponding SI is transmitted. The length of the SI-window is common for all SI messages, and is configurable. Within the SI-window, the corresponding SI message can be transmitted a number of times in any subframe other than MBSFN subframes, uplink subframes in TDD, and subframe #5 of radio frames for which SFN mod 2 = 0. The UE acquires the detailed time-domain scheduling (and other information, e.g. frequency-domain scheduling, used transport format) from decoding SI-RNTI on PDCCH (see TS 36.321 [6]).

A single SI-RNTI is used to address \textit{SystemInformationBlockType1} as well as all SI messages. \textit{SystemInformationBlockType1} configures the SI-window length and the transmission periodicity for the SI messages.

5.2.1.3 System information validity and notification of changes

Change of system information (other than for ETWS and CMAS) only occurs at specific radio frames, i.e. the concept of a modification period is used. System information may be transmitted a number of times with the same content within a modification period, as defined by its scheduling. The modification period boundaries are defined by SFN values for which SFN mod \(m\) = 0, where \(m\) is the number of radio frames comprising the modification period. The modification period is configured by system information.

When the network changes (some of the) system information, it first notifies the UEs about this change, i.e. this may be done throughout a modification period. In the next modification period, the network transmits the updated system
information. These general principles are illustrated in figure 5.2.1.3-1, in which different colours indicate different system information. Upon receiving a change notification, the UE acquires the new system information immediately from the start of the next modification period. The UE applies the previously acquired system information until the UE acquires the new system information.

![Change of system Information](image)

**Figure 5.2.1.3-1: Change of system Information**

The Paging message is used to inform UEs in RRC_IDLE and UEs in RRC_CONNECTED about a system information change. If the UE receives a Paging message including the systemInfoModification, it knows that the system information will change at the next modification period boundary. Although the UE may be informed about changes in system information, no further details are provided e.g. regarding which system information will change.

SystemInformationBlockType1 includes a value tag, systemInfoValueTag, that indicates if a change has occurred in the SI messages. UEs may use systemInfoValueTag, e.g. upon return from out of coverage, to verify if the previously stored SI messages are still valid. Additionally, the UE considers stored system information to be invalid after 3 hours from the moment it was successfully confirmed as valid, unless specified otherwise.

E-UTRAN may not update systemInfoValueTag upon change of some system information e.g. ETWS information, CMAS information, regularly changing parameters like CDMA2000 system time (see 6.3). Similarly, E-UTRAN may not include the systemInfoModification within the Paging message upon change of some system information.

The UE verifies that stored system information remains valid by either checking systemInfoValueTag in SystemInformationBlockType1 after the modification period boundary, or attempting to find the systemInfoModification indication at least modificationPeriodCoeff times during the modification period in case no paging is received, in every modification period. If no paging message is received by the UE during a modification period, the UE may assume that no change of system information will occur at the next modification period boundary. If UE in RRC_CONNECTED, during a modification period, receives one paging message, it may deduce from the presence/absence of systemInfoModification whether a change of system information other than ETWS and CMAS information will occur in the next modification period or not.

ETWS and/or CMAS capable UEs in RRC_CONNECTED shall attempt to read paging at least once every defaultPagingCycle to check whether ETWS and/or CMAS notification is present or not.

### 5.2.1.4 Indication of ETWS notification

ETWS primary notification and/or ETWS secondary notification can occur at any point in time. The Paging message is used to inform ETWS capable UEs in RRC_IDLE and UEs in RRC_CONNECTED about presence of an ETWS primary notification and/or ETWS secondary notification. If the UE receives a Paging message including the etws-Indication, it shall start receiving the ETWS primary notification and/or ETWS secondary notification according to schedulingInfoList contained in SystemInformationBlockType1.

ETWS primary notification is contained in SystemInformationBlockType10 and ETWS secondary notification is contained in SystemInformationBlockType11. Segmentation can be applied for the delivery of a secondary notification. The segmentation is fixed for transmission of a given secondary notification within a cell (i.e. the same segment size for a given segment with the same messageIdentifier, serialNumber and warningMessageSegmentNumber). An ETWS secondary notification corresponds to a single CB data IE as defined according to TS 23.041 [37].

### 5.2.1.5 Indication of CMAS notification

CMAS notification can occur at any point in time. The Paging message is used to inform CMAS capable UEs in RRC_IDLE and UEs in RRC_CONNECTED about presence of one or more CMAS notifications. If the UE receives a Paging message including the cmas-Indication, it shall start receiving the CMAS notifications according to schedulingInfoList contained in SystemInformationBlockType1.

CMAS notification is contained in SystemInformationBlockType12. Segmentation can be applied for the delivery of a CMAS notification. The segmentation is fixed for transmission of a given CMAS notification within a cell (i.e. the
same segment size for a given segment with the same messageIdentifier, serialNumber and warningMessageSegmentNumber). E-UTRAN does not interleave transmissions of CMAS notifications, i.e. all segments of a given CMAS notification transmission are transmitted prior to those of another CMAS notification. A CMAS notification corresponds to a single CB data IE as defined according to TS 23.041 [37].

5.2.2 System information acquisition

5.2.2.1 General

![System information acquisition diagram](image)

Figure 5.2.2.1-1: System information acquisition, normal

The UE applies the system information acquisition procedure to acquire the AS- and NAS- system information that is broadcasted by the E-UTRAN. The procedure applies to UEs in RRC_IDLE and UEs in RRC_CONNECTED.

5.2.2.2 Initiation

The UE shall apply the system information acquisition procedure upon selecting (e.g. upon power on) and upon re-selecting a cell, after handover completion, after entering E-UTRA from another RAT, upon return from out of coverage, upon receiving a notification that the system information has changed, upon receiving an indication about the presence of an ETWS notification, upon receiving an indication about the presence of a CMAS notification, upon receiving a request from CDMA2000 upper layers and upon exceeding the maximum validity duration. Unless explicitly stated otherwise in the procedural specification, the system information acquisition procedure overwrites any stored system information, i.e. delta configuration is not applicable for system information and the UE discontinues using a field if it is absent in system information unless explicitly specified otherwise.

5.2.2.3 System information required by the UE

The UE shall:

1. ensure having a valid version, as defined below, of (at least) the following system information, also referred to as the 'required' system information:

2. if in RRC_IDLE:

3. the MasterInformationBlock and SystemInformationBlockType1 as well as SystemInformationBlockType2 through SystemInformationBlockType8, depending on support of the concerned RATs;

2. if in RRC_CONNECTED:

3. the MasterInformationBlock, SystemInformationBlockType1 and SystemInformationBlockType2 as well as SystemInformationBlockType8, depending on support of CDMA2000;

1. delete any stored system information after 3 hours from the moment it was confirmed to be valid as defined in 5.2.1.3, unless specified otherwise;

1. consider any stored system information except SystemInformationBlockType10, SystemInformationBlockType11 and systemInformationBlockType12 to be invalid if systemInfoValueTag included in the SystemInformationBlockType1 is different from the one of the stored system information;
5.2.2.4 System information acquisition by the UE

The UE shall:

1> apply the specified BCCH configuration defined in 9.1.1.1;

1> if the procedure is triggered by a system information change notification:

2> start acquiring the required system information, as defined in 5.2.2.3, from the beginning of the modification period following the one in which the change notification was received;

NOTE 1: The UE continues using the previously received system information until the new system information has been acquired.

1> if the UE is in RRC_IDLE and enters a cell for which the UE does not have stored a valid version of the system information required in RRC_IDLE, as defined in 5.2.2.3:

2> acquire, using the system information acquisition procedure as defined in 5.2.3, the system information required in RRC_IDLE, as defined in 5.2.2.3;

1> following successful handover completion to a cell for which the UE does not have stored a valid version of the system information required in RRC_CONNECTED, as defined in 5.2.2.3:

2> acquire, using the system information acquisition procedure as defined in 5.2.3, the system information required in RRC_CONNECTED, as defined in 5.2.2.3;

2> upon acquiring the concerned system information:

3> discard the corresponding radio resource configuration information included in the radioResourceConfigCommon previously received in a dedicated message, if any;

1> following a request from CDMA2000 upper layers:

2> acquire SystemInformationBlockType8, as defined in 5.2.3;

1> neither initiate the RRC connection establishment procedure nor initiate transmission of the RRCConnectionReestablishmentRequest message until the UE has a valid version of the MasterInformationBlock and SystemInformationBlockType1 messages as well as SystemInformationBlockType2;

1> if the UE is ETWS capable:

2> upon entering a cell during RRC_IDLE, following successful handover or upon connection re-establishment:

3> discard any previously buffered warningMessageSegment;

3> clear, if any, the current values of messageIdentifier and serialNumber for SystemInformationBlockType11;

2> when the UE acquires SystemInformationBlockType1 following ETWS indication, upon entering a cell during RRC_IDLE, following successful handover or upon connection re-establishment:

3> if schedulingInfoList indicates that SystemInformationBlockType10 is present:

4> start acquiring SystemInformationBlockType10 immediately;

3> if schedulingInfoList indicates that SystemInformationBlockType11 is present:

4> start acquiring SystemInformationBlockType11 immediately;

NOTE 2: UEs shall start acquiring SystemInformationBlockType10 and SystemInformationBlockType11 as described above even when systemInfoValueTag in SystemInformationBlockType1 has not changed.

1> if the UE is CMAS capable:

2> upon entering a cell during RRC_IDLE, following successful handover or upon connection re-establishment:

3> discard any previously buffered warningMessageSegment;
3> clear, if any, stored values of messageIdentifier and serialNumber for SystemInformationBlockType12 associated with the discarded warningMessageSegment;

2> when the UE acquires SystemInformationBlockType1 following CMAS indication, upon entering a cell during RRC_IDLE, following successful handover and upon connection re-establishment:

3> if schedulingInfoList indicates that SystemInformationBlockType12 is present:

4> aquire SystemInformationBlockType12;

NOTE 3: UEs shall start acquiring SystemInformationBlockType12 as described above even when systemInfoValueTag in SystemInformationBlockType1 has not changed.

1> if the UE is interested to receive MBMS services; and

1> if schedulingInfoList indicates that SystemInformationBlockType13 is present and the UE does not have stored a valid version of this system information block:

2> aquire SystemInformationBlockType13;

The UE may apply the received SIBs immediately, i.e. the UE does not need to delay using a SIB until all SI messages have been received. The UE may delay applying the received SIBs until completing lower layer procedures associated with a received or a UE originated RRC message, e.g. an ongoing random access procedure.

NOTE 4: While attempting to acquire a particular SIB, if the UE detects from schedulingInfoList that it is no longer present, the UE should stop trying to acquire the particular SIB.

5.2.2.5 Essential system information missing

The UE shall

1> if in RRC_IDLE or in RRC_CONNECTED while T311 is running:

2> if the UE is unable to acquire the MasterInformationBlock or the SystemInformationBlockType1:

3> consider the cell as barred in accordance with TS 36.304 [4] and;

3> perform barring as if intraFreqReselection is set to 'allowed', and as if the csg-Indication is set to 'FALSE';

2> else if the UE is unable to acquire the SystemInformationBlockType2:

3> treat the cell as barred in accordance with TS 36.304 [4];

5.2.2.6 Actions upon reception of the MasterInformationBlock message

Upon receiving the MasterInformationBlock message the UE shall:

1> apply the radio resource configuration included in the phich-Config;

1> if the UE is in RRC_IDLE or if the UE is in RRC_CONNECTED while T311 is running:

2> if the UE has no valid system information stored according to 5.2.2.3 for the concerned cell:

3> apply the received value of dl-Bandwidth to the ul-Bandwidth until SystemInformationBlockType2 is received;

5.2.2.7 Actions upon reception of the SystemInformationBlockType1 message

Upon receiving the SystemInformationBlockType1 message the UE shall:

1> if the frequency band indicated in the freqBandIndicator is not part of the frequency bands supported by the UE:

2> consider the cell as barred in accordance with TS 36.304 [4] and;
2> perform barring as if intraFreqReselection is set to 'notAllowed', and as if the csg-Indication is set to 'FALSE';

1> else:

2> forward the cellIdentity to upper layers;

2> forward the trackingAreaCode to upper layers;

5.2.2.8 Actions upon reception of SystemInformation messages

No UE requirements related to the contents of the SystemInformation messages apply other than those specified elsewhere e.g. within procedures using the concerned system information, and/ or within the corresponding field descriptions.

5.2.2.9 Actions upon reception of SystemInformationBlockType2

Upon receiving SystemInformationBlockType2, the UE shall:

1> if upper layers indicate that a (UE specific) paging cycle is configured:

2> Apply the shortest of the (UE specific) paging cycle and the defaultPagingCycle included in the radioResourceConfigCommon;

1> else:

2> Apply the defaultPagingCycle included in the radioResourceConfigCommon;

1> if the mbsfn-SubframeConfigList is included:

2> consider that no other DL assignments occur in the MBSFN subframes indicated in the mbsfn-SubframeConfigList:

1> apply the configuration included in the radioResourceConfigCommon;

1> apply the specified PCCH configuration defined in 9.1.1.3;

1> not apply the timeAlignmentTimerCommon;

1> if in RRC_CONNECTED and UE has previously received rlf-TimersAndConstants:

2> The UE shall not update its values of the timers and constants in UE-TimersAndConstants except for the value of timer T300.

5.2.2.10 Actions upon reception of SystemInformationBlockType3

No UE requirements related to the contents of this SystemInformationBlock apply other than those specified elsewhere e.g. within procedures using the concerned system information, and/ or within the corresponding field descriptions.

5.2.2.11 Actions upon reception of SystemInformationBlockType4

No UE requirements related to the contents of this SystemInformationBlock apply other than those specified elsewhere e.g. within procedures using the concerned system information, and/ or within the corresponding field descriptions.

5.2.2.12 Actions upon reception of SystemInformationBlockType5

No UE requirements related to the contents of this SystemInformationBlock apply other than those specified elsewhere e.g. within procedures using the concerned system information, and/ or within the corresponding field descriptions.

5.2.2.13 Actions upon reception of SystemInformationBlockType6

No UE requirements related to the contents of this SystemInformationBlock apply other than those specified elsewhere e.g. within procedures using the concerned system information, and/ or within the corresponding field descriptions.
5.2.2.14 Actions upon reception of SystemInformationBlockType7

No UE requirements related to the contents of this SystemInformationBlock apply other than those specified elsewhere e.g. within procedures using the concerned system information, and/ or within the corresponding field descriptions.

5.2.2.15 Actions upon reception of SystemInformationBlockType8

Upon receiving SystemInformationBlockType8, the UE shall:

1> if the systemTimeInfo is included:
   2> forward the systemTimeInfo to CDMA2000 upper layers;

1> if the UE is in RRC_IDLE and if searchWindowSize is included:
   2> forward the searchWindowSize to CDMA2000 upper layers;

1> if parametersHRPD is included:
   2> forward the preRegistrationInfoHRPD to CDMA2000 upper layers only if the UE has not received the preRegistrationInfoHRPD within an RRCCconnectionReconfiguration message after entering this cell;
   2> if the cellReselectionParametersHRPD is included:
       3> forward the neighCellList to the CDMA2000 upper layers;

1> if the parameters1XRTT is included:
   2> if the csfb-RegistrationParam1XRTT is included:
       3> forward the csfb-RegistrationParam1XRTT to the CDMA2000 upper layers which will use this information to determine if a CS registration/re-registration towards CDMA2000 1xRTT in the EUTRA cell is required;
   2> else:
       3> indicate to CDMA2000 upper layers that CSFB Registration to CDMA2000 1xRTT is not allowed;

2> if the longCodeState1XRTT is included:
   3> forward the longCodeState1XRTT to CDMA2000 upper layers;

2> if the cellReelectionParameters1XRTT is included:
   3> forward the neighCellList to the CDMA2000 upper layers;

2> if the csfb-SupportForDualRxUEs is included:
   3> forward csfb-SupportForDualRxUEs to the CDMA2000 upper layers;

2> else
   3> forward csfb-SupportForDualRxUEs, with its value set to FALSE, to the CDMA2000 upper layers;

2> forward the ac-BarringConfig1XRTT to CDMA2000 upper layers, if included;

5.2.2.16 Actions upon reception of SystemInformationBlockType9

Upon receiving SystemInformationBlockType9, the UE shall:

1> if hnb-Name is included, forward the hnb-Name to upper layers;

5.2.2.17 Actions upon reception of SystemInformationBlockType10

Upon receiving SystemInformationBlockType10, the UE shall:
1> forward the received warningType, warningSecurityInfo (if present), messageIdentifier and serialNumber to upper layers;

5.2.2.18 Actions upon reception of SystemInformationBlockType11

Upon receiving SystemInformationBlockType11, the UE shall:

1> if there is no current value for messageIdentifier and serialNumber for SystemInformationBlockType11; or

1> if either the received value of messageIdentifier or of serialNumber or of both are different from the current values of messageIdentifier and serialNumber for SystemInformationBlockType11:

2> use the received values of messageIdentifier and serialNumber for SystemInformationBlockType11 as the current values of messageIdentifier and serialNumber for SystemInformationBlockType11;

2> discard any previously buffered warningMessageSegment;

2> if all segments of a warning message have been received:

3> assemble the warningMessage from the received warningMessageSegment;

3> forward the received warningMessage, messageIdentifier, serialNumber and dataCodingScheme to upper layers;

3> stop reception of SystemInformationBlockType11;

3> discard the current values of messageIdentifier and serialNumber for SystemInformationBlockType11;

2> else:

3> store the received warningMessageSegment;

3> continue reception of SystemInformationBlockType11;

1> else if all segments of a warning message have been received:

2> assemble the warningMessage from the received warningMessageSegment;

2> forward the received complete warningMessage, messageIdentifier, serialNumber and dataCodingScheme to upper layers;

2> stop reception of SystemInformationBlockType11;

2> discard the current values of messageIdentifier and serialNumber for SystemInformationBlockType11;

1> else:

2> store the received warningMessageSegment;

2> continue reception of SystemInformationBlockType11;

The UE should discard any stored warningMessageSegments and the current value of messageIdentifier and serialNumber for SystemInformationBlockType11 if the complete warningMessage has not been assembled within a period of 3 hours.

5.2.2.19 Actions upon reception of SystemInformationBlockType12

Upon receiving SystemInformationBlockType12, the UE shall:

1> if the SystemInformationBlockType12 contains a complete warningMessage:

2> forward the received warningMessage, messageIdentifier, serialNumber and dataCodingScheme to upper layers;

2> continue reception of SystemInformationBlockType12;

1> else:
2> if the received values of messageIdentifier and serialNumber are the same (each value is the same) as a pair for which a warningMessage is currently being assembled:

3> store the received warningMessageSegment;

3> if all segments of a warning message have been received:

4> assemble the warningMessage from the received warningMessageSegment;

4> forward the received warningMessage, messageIdentifier, serialNumber and dataCodingScheme to upper layers;

4> stop assembling a warningMessage for this messageIdentifier and serialNumber and delete all stored information held for it;

3> continue reception of SystemInformationBlockType12;

2> else if the received values of messageIdentifier and serialNumber are not the same (each value is the same) as any of the pairs for which a warningMessage is currently being assembled:

3> start assembling a warningMessage for this messageIdentifier and serialNumber pair;

3> store the received warningMessageSegment;

3> continue reception of SystemInformationBlockType12;

The UE should discard warningMessageSegments and the associated values of messageIdentifier and serialNumber for SystemInformationBlockType12 if the complete warningMessage has not been assembled within a period of 3 hours.

NOTE: The number of warningMessages that a UE can re-assemble simultaneously is a function of UE implementation.

5.2.2.20 Actions upon reception of SystemInformationBlockType13

No UE requirements related to the contents of this SystemInformationBlock apply other than those specified elsewhere e.g. within procedures using the concerned system information, and/or within the corresponding field descriptions.

5.2.3 Acquisition of an SI message

When acquiring an SI message, the UE shall:

1> determine the start of the SI-window for the concerned SI message as follows:

2> for the concerned SI message, determine the number \(n\) which corresponds to the order of entry in the list of SI messages configured by schedulingInfoList in SystemInformationBlockType1;

2> determine the integer value \(x = (n - 1)w\), where \(w\) is the si-WindowLength;

2> the SI-window starts at the subframe \(#a\), where \(a = x \mod 10\), in the radio frame for which SFN mod \(T = \text{FLOOR}(x/10)\), where \(T\) is the si-Periodicity of the concerned SI message;

NOTE: E-UTRAN should configure an SI-window of 1 ms only if all SIs are scheduled before subframe \(#5\) in radio frames for which SFN mod 2 = 0.

1> receive DL-SCH using the SI-RNTI from the start of the SI-window and continue until the end of the SI-window whose absolute length in time is given by si-WindowLength, or until the SI message was received, excluding the following subframes:

2> subframe \(#5\) in radio frames for which SFN mod 2 = 0;

2> any MBSFN subframes;

2> any uplink subframes in TDD;
1> if the SI message was not received by the end of the SI-window, repeat reception at the next SI-window occasion for the concerned SI message;

5.3 Connection control

5.3.1 Introduction

5.3.1.1 RRC connection control

RRC connection establishment involves the establishment of SRB1. E-UTRAN completes RRC connection establishment prior to completing the establishment of the SI connection, i.e. prior to receiving the UE context information from the EPC. Consequently, AS security is not activated during the initial phase of the RRC connection. During this initial phase of the RRC connection, the E-UTRAN may configure the UE to perform measurement reporting. However, the UE only accepts a handover message when security has been activated.

Upon receiving the UE context from the EPC, E-UTRAN activates security (both ciphering and integrity protection) using the initial security activation procedure. The RRC messages to activate security (command and successful response) are integrity protected, while ciphering is started only after completion of the procedure. That is, the response to the message used to activate security is not ciphered, while the subsequent messages (e.g. used to establish SRB2 and DRBs) are both integrity protected and ciphered.

After having initiated the initial security activation procedure, E-UTRAN initiates the establishment of SRB2 and DRBs, i.e. E-UTRAN may do this prior to receiving the confirmation of the initial security activation from the UE. In any case, E-UTRAN will apply both ciphering and integrity protection for the RRC connection reconfiguration messages used to establish SRB2 and DRBs. E-UTRAN should release the RRC connection if the initial security activation and/or the radio bearer establishment fails (i.e. security activation and DRB establishment are triggered by a joint SI-procedure, which does not support partial success).

For SRB2 and DRBs, security is always activated from the start, i.e. the E-UTRAN does not establish these bearers prior to activating security.

The release of the RRC connection is initiated by E-UTRAN. The procedure may be used to re-direct the UE to an E-UTRA frequency or an inter-RAT carrier frequency. In exceptional cases the UE may abort the RRC connection, i.e. move to RRC_IDLE without notifying E-UTRAN.

5.3.1.2 Security

AS security comprises of the integrity protection of RRC signalling (SRBs) as well as the ciphering of RRC signalling (SRBs) and user data (DRBs).

RRC handles the configuration of the security parameters which are part of the AS configuration: the integrity protection algorithm, the ciphering algorithm and two parameters, namely the keyChangeIndicator and the nextHopChainingCount, which are used by the UE to determine the AS security keys upon handover and/or connection re-establishment.

The integrity protection algorithm is common for signalling radio bearers SRB1 and SRB2. The ciphering algorithm is common for all radio bearers (i.e. SRB1, SRB2 and DRBs). Neither integrity protection nor ciphering applies for SRB0. RRC integrity and ciphering are always activated together, i.e. in one message/procedure. RRC integrity and ciphering are never de-activated. However, it is possible to switch to a 'NULL' ciphering algorithm (ea0).

The 'NULL' integrity protection algorithm (eia0) is used only for the UE in limited service mode [32, TS33.401]. In case the 'NULL' integrity protection algorithm is used, 'NULL' ciphering algorithm is also used.

NOTE 1: Lower layers discard RRC messages for which the integrity check has failed and indicate the integrity verification check failure to RRC.

The AS applies three different security keys: one for the integrity protection of RRC signalling (K_{RRCint}), one for the ciphering of RRC signalling (K_{RRCenc}) and one for the ciphering of user data (K_{UPenc}). All three AS keys are derived from the K_{eNB} key. The K_{eNB} is based on the K_{ASME} key, which is handled by upper layers.
Upon connection establishment new AS keys are derived. No AS-parameters are exchanged to serve as inputs for the derivation of the new AS keys at connection establishment.

The integrity and ciphering of the RRC message used to perform handover is based on the security configuration used prior to the handover and is performed by the source eNB.

The integrity and ciphering algorithms can only be changed upon handover. The four AS keys ($K_{eNB}$, $K_{RRChint}$, $K_{RRCenc}$ and $K_{UPenc}$) change upon every handover and connection re-establishment. The $keyChangeIndication$ is used upon handover and indicates whether the UE should use the keys associated with the latest available $K_{ASME}$ key. The nextHopChainingCount parameter is used upon handover and connection re-establishment by the UE when deriving the new $K_{eNB}$ that is used to generate $K_{RRChint}$, $K_{RRCenc}$ and $K_{UPenc}$ (see TS 33.401 [32]). An intra cell handover procedure may be used to change the keys in RRC_CONNECTED.

For each radio bearer an independent counter (COUNT, as specified in TS 36.323 [8]) is maintained for each direction. For each DRB, the COUNT is used as input for ciphering. For each SRB, the COUNT is used as input for both ciphering and integrity protection. It is not allowed to use the same COUNT value more than once for a given security key. In order to limit the signalling overhead, individual messages/packets include a short sequence number (PDCP SN, as specified in TS 36.323 [8]). In addition, an overflow counter mechanism is used: the hyper frame number (TX_HFN and RX_HFN, as specified in TS 36.323 [8]). The HFN needs to be synchronized between the UE and the eNB. The eNB is responsible for avoiding reuse of the COUNT with the same RB identity and with the same $K_{eNB}$, e.g. due to the transfer of large volumes of data, release and establishment of new RBs. In order to avoid such re-use, the eNB may e.g. use different RB identities for successive RB establishments, trigger an intra cell handover or an RRC_CONNECTED to RRC_IDLE to RRC_CONNECTED transition.

For each SRB, the value provided by RRC to lower layers to derive the 5-bit BEARER parameter used as input for ciphering and for integrity protection is the value of the corresponding srb-Identity with the MSBs padded with zeroes.

5.3.1.3 Connected mode mobility

In RRC_CONNECTED, the network controls UE mobility, i.e. the network decides when the UE shall move to which cell (which may be on another frequency or RAT). For network controlled mobility in RRC_CONNECTED, handover is the only procedure that is defined. The network triggers the handover procedure e.g. based on radio conditions, load. To facilitate this, the network may configure the UE to perform measurement reporting (possibly including the configuration of measurement gaps). The network may also initiate handover blindly, i.e. without having received measurement reports from the UE.

Before sending the handover message to the UE, the source eNB prepares one or more target cells. The target eNB generates the message used to perform the handover, i.e. the message including the AS-configuration to be used in the target cell. The source eNB transparently (i.e. does not alter values/content) forwards the handover message/information received from the target eNB to the UE. When appropriate, the source eNB may initiate data forwarding for (a subset of) the DRBs.

After receiving the handover message, the UE attempts to access the target cell at the first available RACH occasion according to Random Access resource selection defined in TS 36.321 [6], i.e. the handover is asynchronous. Consequently, when allocating a dedicated preamble for the random access in the target cell, E-UTRA shall ensure it is available from the first RACH occasion the UE may use. Upon successful completion of the handover, the UE sends a message used to confirm the handover.

If the target eNB does not support the release of RRC protocol which the source eNB used to configure the UE, the target eNB may be unable to comprehend the UE configuration provided by the source eNB. In this case, the target eNB should use the full configuration option to reconfigure the UE for Handover and Re-establishment. Full configuration option includes an initialization of the radio configuration, which makes the procedure independent of the configuration used in the source cell with the exception that the security algorithms are continued for the RRC re-establishment.

After the successful completion of handover, PDCP SDUs may be re-transmitted in the target cell. This only applies for DRBs using RLC-AM mode and for handovers not involving full configuration option. The further details are specified in TS 36.323 [8]. After the successful completion of handover not involving full configuration option, the SN and the HFN are reset except for the DRBs using RLC-AM mode (for which both SN and HFN continue). For reconfigurations involving the full configuration option, the PDCP entities are newly established (SN and HFN do not continue) for all DRBs irrespective of the RLC mode. The further details are specified in TS 36.323 [8].

One UE behaviour to be performed upon handover is specified, i.e. this is regardless of the handover procedures used within the network (e.g. whether the handover includes X2 or S1 signalling procedures).
The source eNB should, for some time, maintain a context to enable the UE to return in case of handover failure. After having detected handover failure, the UE attempts to resume the RRC connection either in the source or in another cell using the RRC re-establishment procedure. This connection resumption succeeds only if the accessed cell is prepared, i.e. concerns a cell of the source eNB or of another eNB towards which handover preparation has been performed.

Normal measurement and mobility procedures are used to support handover to cells broadcasting a CSG identity. In addition, E-UTRAN may configure the UE to report that it is entering or leaving the proximity of cell(s) included in its CSG whitelist. Furthermore, E-UTRAN may request the UE to provide additional information broadcast by the handover candidate cell e.g. cell global identity, CSG identity, CSG membership status.

NOTE E-UTRAN may use the ‘proximity report’ to configure measurements as well as to decide whether or not to request additional information broadcast by the handover candidate cell. The additional information is used to verify whether or not the UE is authorised to access the target cell and may also be needed to identify handover candidate cell (PCI confusion i.e. when the physical layer identity that is included in the measurement report does not uniquely identify the cell).

5.3.2 Paging

5.3.2.1 General

The purpose of this procedure is:
- to transmit paging information to a UE in RRC_IDLE and/ or;
- to inform UEs in RRC_IDLE and UEs in RRC_CONNECTED about a system information change and/ or;
- to inform about an ETWS primary notification and/ or ETWS secondary notification and/ or;
- to inform about a CMAS notification.

The paging information is provided to upper layers, which in response may initiate RRC connection establishment, e.g. to receive an incoming call.

5.3.2.2 Initiation

E-UTRAN initiates the paging procedure by transmitting the Paging message at the UE’s paging occasion as specified in TS 36.304 [4]. E-UTRAN may address multiple UEs within a Paging message by including one PagingRecord for each UE. E-UTRAN may also indicate a change of system information, and/ or provide an ETWS notification or a CMAS notification in the Paging message.

5.3.2.3 Reception of the Paging message by the UE

Upon receiving the Paging message, the UE shall:
1> if in RRC_IDLE, for each of the PagingRecord, if any, included in the Paging message:

2> if the ue-Identity included in the PagingRecord matches one of the UE identities allocated by upper layers:

3> forward the ue-Identity and the cn-Domain to the upper layers;
1> if the `systemInfoModification` is included:
   2> re-acquire the required system information using the system information acquisition procedure as specified in 5.2.2.

1> if the `etws-Indication` is included and the UE is ETWS capable:
   2> re-acquire `SystemInformationBlockType1` immediately, i.e., without waiting until the next system information modification period boundary;
   2> if the `schedulingInfoList` indicates that `SystemInformationBlockType10` is present:
      3> acquire `SystemInformationBlockType10`;
   2> if the `schedulingInfoList` indicates that `SystemInformationBlockType11` is present:
      3> acquire `SystemInformationBlockType11`;

1> if the `cmas-Indication` is included and the UE is CMAS capable:
   2> re-acquire `SystemInformationBlockType1` immediately, i.e., without waiting until the next system information modification period boundary as specified in 5.2.1.5;
   2> if the `schedulingInfoList` indicates that `SystemInformationBlockType12` is present:
      3> acquire `SystemInformationBlockType12`;

5.3.3 RRC connection establishment

5.3.3.1 General

![Diagram of RRC connection establishment, successful](image)

![Diagram of RRC connection establishment, network reject](image)
The purpose of this procedure is to establish an RRC connection. RRC connection establishment involves SRB1 establishment. The procedure is also used to transfer the initial NAS dedicated information/message from the UE to E-UTRAN.

E-UTRAN applies the procedure as follows:
- to establish SRB1 only.

### 5.3.3.2 Initiation

The UE initiates the procedure when upper layers request establishment of an RRC connection while the UE is in RRC_IDLE.

Upon initiation of the procedure, the UE shall:

1> if the UE is establishing the RRC connection for mobile terminating calls:
   2> if timer T302 is running:
      3> consider access to the cell as barred;
   2> else:
      3> consider access to the cell as not barred;
1> else if the UE is establishing the RRC connection for emergency calls:
   2> if SystemInformationBlockType2 includes the ac-BarringInfo:
      3> if the ac-BarringForEmergency is set to FALSE:
         4> consider access to the cell as not barred;
      3> else if the UE has one or more Access Classes, as stored on the USIM, with a value in the range 11..15, which is valid for the UE to use according to TS 22.011 [10] and TS 23.122 [11]:
         4> if the ac-BarringInfo includes ac-BarringForMO-Data, and for all of the valid Access Classes for the UE, the corresponding bit in the ac-BarringForSpecialAC contained in ac-BarringForMO-Data is set to one:
            5> consider access to the cell as barred;
         4> else:
            5> consider access to the cell as not barred;
      3> else:
         4> consider access to the cell as barred;
   2> else:
      3> consider access to the cell as not barred;
1> else if the UE is establishing the RRC connection for mobile originating calls:
   2> if timer T302 or T303 is running:
      3> consider access to the cell as barred;
   2> else if SystemInformationBlockType2 includes the ac-BarringInfo and the ac-BarringForMO-Data is present:
      3> if the UE has one or more Access Classes, as stored on the USIM, with a value in the range 11..15, which is valid for the UE to use according to TS 22.011 [10] and TS 23.122 [11], and
for at least one of these Access Classes the corresponding bit in the ac-BarringForSpecialAC contained in ac-BarringForMO-Data is set to zero:

consider access to the cell as not barred;

else:

draw a random number 'rand' uniformly distributed in the range: 0 ≤ rand < 1;

if 'rand' is lower than the value indicated by ac-BarringFactor included in ac-BarringForMO-Data:

consider access to the cell as not barred;

else:

consider access to the cell as barred;

else (the UE is establishing the RRC connection for mobile originating signalling):

if timer T302 or T305 is running:

consider access to the cell as barred;

else if SystemInformationBlockType2 includes the ac-BarringInfo and the ac-BarringForMO-Signalling is present:

if the UE has one or more Access Classes, as stored on the USIM, with a value in the range 11..15, which is valid for the UE to use according to TS 22.011 [10] and TS 23.122 [11], and for at least one of these Access Classes the corresponding bit in the ac-BarringForSpecialAC contained in ac-BarringForMO-Signalling is set to zero:

consider access to the cell as not barred;

else:

draw a random number 'rand' uniformly distributed in the range: 0 ≤ rand < 1;

if 'rand' is lower than the value indicated by ac-BarringFactor included in ac-BarringForMO-Signalling:

consider access to the cell as not barred;

else:

consider access to the cell as barred;

else:

consider access to the cell as not barred;

if access to the cell, as specified above, is not barred:

apply the default physical channel configuration as specified in 9.2.4;

apply the default semi-persistent scheduling configuration as specified in 9.2.3;

apply the default MAC main configuration as specified in 9.2.2;

apply the CCCH configuration as specified in 9.1.1.2;

apply the timeAlignmentTimerCommon included in SystemInformationBlockType2;

start timer T300;
2> initiate transmission of the **RRCConnectionRequest** message in accordance with 5.3.3.3;

NOTE 2: Upon initiating the connection establishment procedure, the UE is not required to ensure it maintains up-to-date system information applicable only forUEs in RRC_IDLE state. However, the UE needs to perform system information acquisition upon cell re-selection.

1> else:

2> if the UE is establishing the RRC connection for mobile originating calls and if both timers T302 and T303 are not running:

3> draw a random number ’rand’ that is uniformly distributed in the range $0 \leq rand < 1$;

3> start timer T303 with the timer value calculated as follows, using the ac-BarringTime included in ac-BarringForMO-Data:

$$T303 = (0.7 + 0.6 \times rand) \times ac\text{-}BarringTime$$

3> inform upper layers about the failure to establish the RRC connection and that access barring for mobile originating calls is applicable, upon which the procedure ends;

2> else if the UE is establishing the RRC connection for mobile originating signalling and if both timers T302 and T305 are not running:

3> draw a random number ’rand’ that is uniformly distributed in the range $0 \leq rand < 1$;

3> start timer T305 with the timer value calculated as follows, using the ac-BarringTime included in ac-BarringForMO-Signalling:

$$T305 = (0.7 + 0.6 \times rand) \times ac\text{-}BarringTime$$

3> inform upper layers about the failure to establish the RRC connection and that access barring for mobile originating signalling is applicable, upon which the procedure ends;

2> else if the UE is establishing the RRC connection for emergency calls:

3> inform upper layers about the failure to establish the RRC connection and that access barring for emergency calls is applicable, upon which the procedure ends;

2> else:

3> inform upper layers about the failure to establish the RRC connection, upon which the procedure ends;

### 5.3.3.3 Actions related to transmission of **RRCConnectionRequest** message

The UE shall set the contents of **RRCConnectionRequest** message as follows:

1> set the **ue-Identity** as follows:

2> if upper layers provide an S-TMSI:

3> set the **ue-Identity** to the value received from upper layers;

2> else:

3> draw a random value in the range $0 \ldots 2^{40}-1$ and set the **ue-Identity** to this value;

NOTE 1: Upper layers provide the S-TMSI if the UE is registered in the TA of the current cell.

1> set the **establishmentCause** in accordance with the information received from upper layers;

The UE shall submit the **RRCConnectionRequest** message to lower layers for transmission.

The UE shall continue cell re-selection related measurements as well as cell re-selection evaluation. If the conditions for cell re-selection are fulfilled, the UE shall perform cell re-selection as specified in 5.3.3.5.
5.3.3.4 Reception of the **RRCConnectionSetup** by the UE

NOTE: Prior to this, lower layer signalling is used to allocate a C-RNTI. For further details see TS 36.321 [6];

The UE shall:

1> perform the radio resource configuration procedure in accordance with the received `radioResourceConfigDedicated` and as specified in 5.3.10;
1> if stored, discard the cell reselection priority information provided by the `idleModeMobilityControlInfo` or inherited from another RAT;
1> stop timer T300;
1> stop timer T302, if running;
1> stop timer T303, if running;
1> stop timer T305, if running;
1> perform the actions as specified in 5.3.3.7;
1> stop timer T320, if running;
1> enter RRC_CONNECTED;
1> stop the cell re-selection procedure;
1> set the content of **RRCConnectionSetupComplete** message as follows:

2> set the `selectedPLMN-Identity` to the PLMN selected by upper layers (see TS 23.122 [11], TS 24.301 [35]) from the PLMN(s) included in the `plmn-IdentityList` in SystemInformationBlockType1;
2> if upper layers provide the 'Registered MME', include and set the `registeredMME` as follows:
   3> if the PLMN identity of the 'Registered MME' is different from the PLMN selected by the upper layers:
      4> include the `plmnIdentity` in the `registeredMME` and set it to the value of the PLMN identity in the 'Registered MME' received from upper layers;
   3> set the `mmegi` and the `mmec` to the value received from upper layers;
2> set the `dedicatedInfoNAS` to include the information received from upper layers;
2> submit the **RRCConnectionSetupComplete** message to lower layers for transmission, upon which the procedure ends;

5.3.3.5 Cell re-selection while T300, T302, T303 or T305 is running

The UE shall:

1> if cell reselection occurs while T300, T302, T303 or T305 is running:
   2> if timer T302, T303 and/or T305 is running:
      3> stop timer T302, T303 and T305, whichever ones were running;
      3> perform the actions as specified in 5.3.3.7;
   2> if timer T300 is running:
      3> stop timer T300;
      3> reset MAC, release the MAC configuration and re-establish RLC for all RBs that are established;
      3> inform upper layers about the failure to establish the RRC connection, upon which the procedure ends;
5.3.3.6 T300 expiry
The UE shall:
1> if timer T300 expires:
   2> reset MAC, release the MAC configuration and re-establish RLC for all RBs that are established;
   2> inform upper layers about the failure to establish the RRC connection, upon which the procedure ends;

5.3.3.7 T302, T303 or T305 expiry or stop
The UE shall:
1> if timer T302 expires or is stopped:
   2> inform upper layers about barring alleviation for mobile terminating access;
   2> if timer T303 is not running:
      3> inform upper layers about barring alleviation for mobile originating calls;
   2> if timer T305 is not running:
      3> inform upper layers about barring alleviation for mobile originating signalling;
1> if timer T303 expires or is stopped:
   2> if timer T302 is not running:
      3> inform upper layers about barring alleviation for mobile originating calls;
1> if timer T305 expires or is stopped:
   2> if timer T302 is not running:
      3> inform upper layers about barring alleviation for mobile originating signalling;

5.3.3.8 Reception of the RRCConnectionReject by the UE
The UE shall:
1> stop timer T300;
1> reset MAC and release the MAC configuration;
1> start timer T302, with the timer value set to the waitTime;
1> inform upper layers about the failure to establish the RRC connection and that access barring for mobile originating calls, mobile originating signalling and mobile terminating access is applicable, upon which the procedure ends;

5.3.3.9 Abortion of RRC connection establishment
If upper layers abort the RRC connection establishment procedure while the UE has not yet entered RRC_CONNECTED, the UE shall:
1> stop timer T300, if running;
1> reset MAC, release the MAC configuration and re-establish RLC for all RBs that are established;

5.3.3.10 Handling of SSAC related parameters
Upon request from the upper layers, the UE shall:
1> set the local variables \( BarringFactorForMMTEL\text{-}Voice \) and \( BarringTimeForMMTEL\text{-}Voice \) as follows:

2> if the UE is in RRC\_IDLE and \( ssac\text{-}BarringForMMTEL\text{-}Voice \) is present:

3> if the UE has one or more Access Classes, as stored on the USIM, with a value in the range 11..15, which is valid for the UE to use according to TS 22.011 [10] and TS 23.122 [11], and

NOTE: ACs 12, 13, 14 are only valid for use in the home country and ACs 11, 15 are only valid for use in the HPLMN/ EHPLMN.

3> if, for at least one of these Access Classes, the corresponding bit in the \( ac\text{-}BarringForSpecialAC \) contained in \( ssac\text{-}BarringForMMTEL\text{-}Voice \) is set to zero:

4> set \( BarringFactorForMMTEL\text{-}Voice \) to one and \( BarringTimeForMMTEL\text{-}Voice \) to zero;

3> else:

4> set \( BarringFactorForMMTEL\text{-}Voice \) and \( BarringTimeForMMTEL\text{-}Voice \) to the value of \( ac\text{-}BarringFactor \) and \( ac\text{-}BarringTime \) included in \( ssac\text{-}BarringForMMTEL\text{-}Voice \), respectively;

2> else set \( BarringFactorForMMTEL\text{-}Voice \) to one and \( BarringTimeForMMTEL\text{-}Voice \) to zero;

1> set the local variables \( BarringFactorForMMTEL\text{-}Video \) and \( BarringTimeForMMTEL\text{-}Video \) as follows:

2> if the UE is in RRC\_IDLE and \( ssac\text{-}BarringForMMTEL\text{-}Video \) is present:

3> if the UE has one or more Access Classes, as stored on the USIM, with a value in the range 11..15, which is valid for the UE to use according to TS 22.011 [10] and TS 23.122 [11], and

3> if, for at least one of these Access Classes, the corresponding bit in the \( ac\text{-}BarringForSpecialAC \) contained in \( ssac\text{-}BarringForMMTEL\text{-}Video \) is set to zero:

4> set \( BarringFactorForMMTEL\text{-}Video \) to one and \( BarringTimeForMMTEL\text{-}Video \) to zero;

3> else:

4> set \( BarringFactorForMMTEL\text{-}Video \) and \( BarringTimeForMMTEL\text{-}Video \) to the value of \( ac\text{-}BarringFactor \) and \( ac\text{-}BarringTime \) included in \( ssac\text{-}BarringForMMTEL\text{-}Video \), respectively;

2> else set \( BarringFactorForMMTEL\text{-}Video \) to one and \( BarringTimeForMMTEL\text{-}Video \) to zero;

1> forward the variables \( BarringFactorForMMTEL\text{-}Voice \), \( BarringTimeForMMTEL\text{-}Voice \), \( BarringFactorForMMTEL\text{-}Video \) and \( BarringTimeForMMTEL\text{-}Video \) to the upper layers;

5.3.4 Initial security activation

5.3.4.1 General

![Diagram](image-url)

Figure 5.3.4.1-1: Security mode command, successful
Figure 5.3.4.1-2: Security mode command, failure

The purpose of this procedure is to activate AS security upon RRC connection establishment.

5.3.4.2 Initiation

E-UTRAN initiates the security mode command procedure to a UE in RRC_CONNECTED. Moreover, E-UTRAN applies the procedure as follows:

- when only SRB1 is established, i.e. prior to establishment of SRB2 and/ or DRBs.

5.3.4.3 Reception of the SecurityModeCommand by the UE

The UE shall:

1> derive the $K_{enb}$ key, as specified in TS 33.401 [32];

1> derive the $K_{RRCint}$ key associated with the $integrityProtAlgorithm$ indicated in the SecurityModeCommand message, as specified in TS 33.401 [32];

1> request lower layers to verify the integrity protection of the SecurityModeCommand message, using the algorithm indicated by the $integrityProtAlgorithm$ as included in the SecurityModeCommand message and the $K_{RRCint}$ key;

1> if the SecurityModeCommand message passes the integrity protection check:

2> derive the $K_{RRCenc}$ key and the $K_{UPenc}$ key associated with the $cipheringAlgorithm$ indicated in the SecurityModeCommand message, as specified in TS 33.401 [32];

2> configure lower layers to apply integrity protection using the indicated algorithm and the $K_{RRCint}$ key immediately, i.e. integrity protection shall be applied to all subsequent messages received and sent by the UE, including the SecurityModeComplete message;

2> configure lower layers to apply ciphering using the indicated algorithm, the $K_{RRCenc}$ key and the $K_{UPenc}$ key after completing the procedure, i.e. ciphering shall be applied to all subsequent messages received and sent by the UE, except for the SecurityModeComplete message which is sent unciphered;

2> consider AS security to be activated;

2> submit the SecurityModeComplete message to lower layers for transmission, upon which the procedure ends;

1> else:

2> continue using the configuration used prior to the reception of the SecurityModeCommand message, i.e. neither apply integrity protection nor ciphering.

2> submit the SecurityModeFailure message to lower layers for transmission, upon which the procedure ends;
5.3.5 RRC connection reconfiguration

5.3.5.1 General

The purpose of this procedure is to modify an RRC connection, e.g., to establish/modify/release RBs, to perform handover, to setup/modify/release measurements. As part of the procedure, NAS dedicated information may be transferred from E-UTRAN to the UE.

5.3.5.2 Initiation

E-UTRAN may initiate the RRC connection reconfiguration procedure to a UE in RRC_CONNECTED. E-UTRAN applies the procedure as follows:

- the mobilityControlInfo is included only when AS-security has been activated, and SRB2 with at least one DRB are setup and not suspended;
- the establishment of RBs (other than SRB1, that is established during RRC connection establishment) is included only when AS security has been activated;

5.3.5.3 Reception of an RRCConnectionReconfiguration not including the mobilityControlInfo by the UE

If the RRCConnectionReconfiguration message does not include the mobilityControlInfo and the UE is able to comply with the configuration included in this message, the UE shall:

1> if this is the first RRCConnectionReconfiguration message after successful completion of the RRC Connection Re-establishment procedure:

2> re-establish PDCP for SRB2 and for all DRBs that are established, if any;

2> re-establish RLC for SRB2 and for all DRBs that are established, if any;

2> if the RRCConnectionReconfiguration message includes the fullConfig:
3> perform the radio resource configuration procedure as specified in section 5.3.5.8;
2> if the \textit{RRCConnectionReconfiguration} message includes the \textit{radioResourceConfigDedicated}:
3> perform the radio resource configuration procedure as specified in 5.3.10;
2> resume SRB2 and all DRBs that are suspended, if any;

NOTE 1: The handling of the radio bearers after the successful completion of the PDCP re-establishment, e.g. the re-transmission of unacknowledged PDCP SDUs (as well as the associated status reporting), the handling of the SN and the HFN, is specified in TS 36.323 [8].

1> else:
2> if the \textit{RRCConnectionReconfiguration} message includes the \textit{radioResourceConfigDedicated}:
3> perform the radio resource configuration procedure as specified in 5.3.10;

NOTE 2: If the \textit{RRCConnectionReconfiguration} message includes the establishment of radio bearers other than SRB1, the UE may start using these radio bearers immediately, i.e. there is no need to wait for an outstanding acknowledgment of the \textit{SecurityModeComplete} message.

1> if the \textit{RRCConnectionReconfiguration} message includes the \textit{dedicatedInfoNASList}:
2> forward each element of the \textit{dedicatedInfoNASList} to upper layers in the same order as listed;
1> if the \textit{RRCConnectionReconfiguration} message includes the \textit{measConfig}:
2> perform the measurement configuration procedure as specified in 5.5.2;
1> if the \textit{RRCConnectionReconfiguration} message includes the \textit{reportProximityConfig}:
2> perform the proximity indication in accordance with the received \textit{reportProximityConfig};
1> submit the \textit{RRCConnectionReconfigurationComplete} message to lower layers for transmission using the new configuration, upon which the procedure ends;

5.3.5.4 Reception of an \textit{RRCConnectionReconfiguration} including the \textit{mobilityControlInfo} by the UE (handover)

If the \textit{RRCConnectionReconfiguration} message includes the \textit{mobilityControlInfo} and the UE is able to comply with the configuration included in this message, the UE shall:

1> stop timer T310, if running;
1> start timer T304 with the timer value set to $t_{304}$, as included in the \textit{mobilityControlInfo};
1> if the \textit{carrierFreq} is included:
2> consider the target cell to be one on the frequency indicated by the \textit{carrierFreq} with a physical cell identity indicated by the \textit{targetPhysCellId};
1> else:
2> consider the target cell to be one on the current frequency with a physical cell identity indicated by the \textit{targetPhysCellId};
1> start synchronising to the DL of the target cell;

NOTE 1: The UE should perform the handover as soon as possible following the reception of the RRC message triggering the handover, which could be before confirming successful reception (HARQ and ARQ) of this message.

1> reset MAC;
1> re-establish PDCP for all RBs that are established;
NOTE 2: The handling of the radio bearers after the successful completion of the PDCP re-establishment, e.g. the re-transmission of unacknowledged PDCP SDUs (as well as the associated status reporting), the handling of the SN and the HFN, is specified in TS 36.323 [8].

1> re-establish RLC for all RBs that are established;
1> apply the value of the newUE-Identity as the C-RNTI;
1> if the RRCConnectionReconfiguration message includes the fullConfig:
   2> perform the radio resource configuration procedure as specified in section 5.3.5.8;
1> configure lower layers in accordance with the received radioResourceConfigCommon;
1> configure lower layers in accordance with any additional fields, not covered in the previous, if included in the received mobilityControlInfo;
1> if the RRCConnectionReconfiguration message includes the radioResourceConfigDedicated:
   2> perform the radio resource configuration procedure as specified in 5.3.10;
1> if the keyChangeIndicator received in the securityConfigHO is set to TRUE:
   2> update the K_{CNB} key based on the fresh K_{ASME} key taken into use with the previous successful NAS SMC procedure, as specified in TS 33.401 [32];
1> else:
   2> update the K_{CNB} key based on the current K_{ASN} or the NH, using the nextHopChainingCount value indicated in the securityConfigHO, as specified in TS 33.401 [32];
1> store the nextHopChainingCount value;
1> if the securityAlgorithmConfig is included in the securityConfigHO:
   2> derive the K_{RRCinc} key associated with the integrityProtAlgorithm, as specified in TS 33.401 [32];
   2> derive the K_{RRCenc} key and the K_{UPenc} key associated with the cipheringAlgorithm, as specified in TS 33.401 [32];
1> else:
   2> derive the K_{RRCinc} key associated with the current integrity algorithm, as specified in TS 33.401 [32];
   2> derive the K_{RRCenc} key and the K_{UPenc} key associated with the current ciphering algorithm, as specified in TS 33.401 [32];
1> configure lower layers to apply the integrity protection algorithm and the K_{RRCinc} key, i.e. the integrity protection configuration shall be applied to all subsequent messages received and sent by the UE, including the message used to indicate the successful completion of the procedure;
1> configure lower layers to apply the ciphering algorithm, the K_{RRCenc} key and the K_{UPenc} key, i.e. the ciphering configuration shall be applied to all subsequent messages received and sent by the UE, including the message used to indicate the successful completion of the procedure;
1> perform the measurement related actions as specified in 5.5.6.1;
1> if the RRCConnectionReconfiguration message includes the measConfig:
   2> perform the measurement configuration procedure as specified in 5.5.2;
1> release reportProximityConfig and clear any associated proximity status reporting timer;
1> if the RRCConnectionReconfiguration message includes the reportProximityConfig:
   2> perform the proximity indication in accordance with the received reportProximityConfig;
1> submit the RRCConnectionReconfigurationComplete message to lower layers for transmission;
1> if MAC successfully completes the random access procedure:
   2> stop timer T304;
   2> apply the parts of the CQI reporting configuration, the scheduling request configuration and the sounding RS configuration that do not require the UE to know the SFN of the target cell, if any;
   2> apply the parts of the measurement and the radio resource configuration that require the UE to know the SFN of the target cell (e.g. measurement gaps, periodic CQI reporting, scheduling request configuration, sounding RS configuration), if any, upon acquiring the SFN of the target cell;

NOTE 3: Whenever the UE shall setup or reconfigure a configuration in accordance with a field that is received it applies the new configuration, except for the cases addressed by the above statements.

2> the procedure ends;

NOTE 4: The UE is not required to determine the SFN of the target cell by acquiring system information from that cell before performing RACH access in the target cell.

5.3.5.5 Reconfiguration failure

The UE shall:

1> if the UE is unable to comply with (part of) the configuration included in the \textit{RRCConnectionReconfiguration} message:
   2> continue using the configuration used prior to the reception of \textit{RRCConnectionReconfiguration} message;
   2> if security has not been activated:
      3> perform the actions upon leaving RRC\_CONNECTED as specified in 5.3.12, with release cause ‘other’;
   2> else:
      3> initiate the connection re-establishment procedure as specified in 5.3.7, upon which the connection reconfiguration procedure ends;

NOTE 1: The UE may apply above failure handling also in case the \textit{RRCConnectionReconfiguration} message causes a protocol error for which the generic error handling as defined in 5.7 specifies that the UE shall ignore the message.

NOTE 2: If the UE is unable to comply with part of the configuration, it does not apply any part of the configuration, i.e. there is no partial success/ failure.

5.3.5.6 T304 expiry (handover failure)

The UE shall:

1> if T304 expires (handover failure):
   2> revert back to the configuration used in the source cell, excluding the configuration configured by the \textit{physicalConfigDedicated}, the \textit{mac-\_MainConfig} and the \textit{sps-\_Config};
   2> initiate the connection re-establishment procedure as specified in 5.3.7, upon which the RRC connection reconfiguration procedure ends;

5.3.5.7 Void

5.3.5.8 Radio Resource Configuration involving full configuration option

The UE shall:
1> release/clear all common and dedicated current configurations except the security configuration and PDCP, RLC and logical channel configurations for the RBs;

1> if the RRCConnectionReconfiguration message includes the mobilityControlInfo:

2> apply the default physical channel configuration as specified in 9.2.4;

2> apply the default semi-persistent scheduling configuration as specified in 9.2.3;

2> apply the default MAC main configuration as specified in 9.2.2;

1> for each srb-Identity value included in the srb-ToAddModList (SRB reconfiguration):

2> apply the specified configuration defined in 9.1.2 for the corresponding SRB;

2> apply the corresponding default RLC configuration for the SRB specified in 9.2.1.1 for SRB1 or in 9.2.1.2 for SRB2;

2> apply the corresponding default logical channel configuration for the SRB as specified in 9.2.1.1 for SRB1 or in 9.2.1.2 for SRB2;

NOTE 1: This is to get the SRBs (SRB1 and SRB2 for handover and SRB2 for reconfiguration after reestablishment) to a known state from which the reconfiguration message can do further configuration.

1> for each eps-BearerIdentity value included in the drb-ToAddModList that is part of the current UE configuration:

2> release the PDCP entity;

2> release the RLC entity or entities;

2> release the DTCH logical channel;

2> release the drb-identity;

NOTE 2: This will retain the eps-bearerIdentity but remove the DRBs including drb-identity of these bearers from the current UE configuration and trigger the setup of the DRBs within the AS in Section 5.3.10.3 using the new configuration. The eps-bearerIdentity acts as the anchor for associating the released and re-setup DRB.

1> for each eps-BearerIdentity value that is part of the current UE configuration but not part of the drb-ToAddModList:

2> perform DRB release as specified in 5.3.10.2;

5.3.6 Counter check

5.3.6.1 General

Figure 5.3.6.1-1: Counter check procedure
The counter check procedure is used by E-UTRAN to request the UE to verify the amount of data sent/ received on each DRB. More specifically, the UE is requested to check if, for each DRB, the most significant bits of the COUNT match with the values indicated by E-UTRAN.

NOTE: The procedure enables E-UTRAN to detect packet insertion by an intruder (a 'man in the middle').

5.3.6.2 Initiation

E-UTRAN initiates the procedure by sending a CounterCheck message.

NOTE: E-UTRAN may initiate the procedure when any of the COUNT values reaches a specific value.

5.3.6.3 Reception of the CounterCheck message by the UE

Upon receiving the CounterCheck message, the UE shall:

1> for each DRB that is established:
   2> if no COUNT exists for a given direction (uplink or downlink) because it is a uni-directional bearer configured only for the other direction:
      3> assume the COUNT value to be '0' for the unused direction;
   2> if the drb-Identity is not included in the drb-CountMSB-InfoList:
      3> include the DRB in the drb-CountInfoList in the CounterCheckResponse message by including the drb-Identity, the count-Uplink and the count-Downlink set to the value of the corresponding COUNT;
   2> else if, for at least one direction, the most significant bits of the COUNT are different from the value indicated in the drb-CountMSB-InfoList:
      3> include the DRB in the drb-CountInfoList in the CounterCheckResponse message by including the drb-Identity, the count-Uplink and the count-Downlink set to the value of the corresponding COUNT;

1> for each DRB that is included in the drb-CountMSB-InfoList in the CounterCheck message that is not established:
   2> include the DRB in the drb-CountInfoList in the CounterCheckResponse message by including the drb-Identity, the count-Uplink and the count-Downlink with the most significant bits set identical to the corresponding values in the drb-CountMSB-InfoList and the least significant bits set to zero;

1> submit the CounterCheckResponse message to lower layers for transmission upon which the procedure ends;

5.3.7 RRC connection re-establishment

5.3.7.1 General

![Diagram of RRC connection re-establishment]

Figure 5.3.7.1-1: RRC connection re-establishment, successful
The purpose of this procedure is to re-establish the RRC connection, which involves the resumption of SRB1 operation and the re-activation of security.

A UE in RRC_CONNECTED, for which security has been activated, may initiate the procedure in order to continue the RRC connection. The connection re-establishment succeeds only if the concerned cell is prepared i.e. has a valid UE context. In case E-UTRAN accepts the re-establishment, SRB1 operation resumes while the operation of other radio bearers remains suspended. If AS security has not been activated, the UE does not initiate the procedure but instead moves to RRC_IDLE directly.

E-UTRAN applies the procedure as follows:
- to reconfigure SRB1 and to resume data transfer only for this RB;
- to re-activate AS security without changing algorithms.

5.3.7.2 Initiation

The UE shall only initiate the procedure when AS security has been activated. The UE initiates the procedure when one of the following conditions is met:

1. upon detecting radio link failure, in accordance with 5.3.11; or
2. upon handover failure, in accordance with 5.3.5.6; or
3. upon mobility from E-UTRA failure, in accordance with 5.4.3.5; or
4. upon integrity check failure indication from lower layers; or
5. upon an RRC connection reconfiguration failure, in accordance with 5.3.5.5;

Upon initiation of the procedure, the UE shall:

1. stop timer T310, if running;
2. start timer T311;
3. suspend all RBs except SRB0;
4. reset MAC;
5. apply the default physical channel configuration as specified in 9.2.4;
6. apply the default semi-persistent scheduling configuration as specified in 9.2.3;
7. apply the default MAC main configuration as specified in 9.2.2;
8. release reportProximityConfig and clear any associated proximity status reporting timer;
9. perform cell selection in accordance with the cell selection process as specified in TS 36.304 [4];
5.3.7.3 Actions following cell selection while T311 is running

Upon selecting a suitable E-UTRA cell, the UE shall:

1> stop timer T311;
1> start timer T301;
1> apply the \textit{timeAlignmentTimerCommon} included in \textit{SystemInformationBlockType2};
1> initiate transmission of the \textit{RRCConnectionReestablishmentRequest} message in accordance with 5.3.7.4;

\textbf{NOTE:} This procedure applies also if the UE returns to the source cell.

Upon selecting an inter-RAT cell, the UE shall:

1> perform the actions upon leaving RRC\_CONNECTED as specified in 5.3.12, with release cause 'RRC connection failure';

5.3.7.4 Actions related to transmission of \textit{RRCConnectionReestablishmentRequest} message

The UE shall set the contents of \textit{RRCConnectionReestablishmentRequest} message as follows:

1> set the \textit{ue-Identity} as follows:

2> set the \textit{c-RNTI} to the C-RNTI used in the source cell (handover and mobility from E-UTRA failure) or used in the cell in which the trigger for the re-establishment occurred (other cases);
2> set the \textit{physCellId} to the physical cell identity of the source cell (handover and mobility from E-UTRA failure) or of the cell in which the trigger for the re-establishment occurred (other cases);
2> set the \textit{shortMAC-I} to the 16 least significant bits of the MAC-I calculated:
3> over the ASN.1 encoded as per section 8 (i.e., a multiple of 8 bits) \textit{VarShortMAC-Input};
3> with the \textit{K_{RRCint}} key and integrity protection algorithm that was used in the source cell (handover and mobility from E-UTRA failure) or of the cell in which the trigger for the re-establishment occurred (other cases); and
3> with all input bits for COUNT, BEARER and DIRECTION set to binary ones;
1> set the \textit{reestablishmentCause} as follows:

2> if the re-establishment procedure was initiated due to reconfiguration failure as specified in 5.3.5.5 (the UE is unable to comply with the reconfiguration):
3> set the \textit{reestablishmentCause} to the value 'reconfigurationFailure';
2> else if the re-establishment procedure was initiated due to handover failure as specified in 5.3.5.6 (intra-LTE handover failure) or 5.4.3.5 (inter-RAT mobility from EUTRA failure):
3> set the \textit{reestablishmentCause} to the value 'handoverFailure';
2> else:
3> set the \textit{reestablishmentCause} to the value 'otherFailure';

The UE shall submit the \textit{RRCConnectionReestablishmentRequest} message to lower layers for transmission.

5.3.7.5 Reception of the \textit{RRCConnectionReestablishment} by the UE

\textbf{NOTE:} Prior to this, lower layer signalling is used to allocate a C-RNTI. For further details see TS 36.321 [6];

The UE shall:
1> stop timer T301;
1> re-establish PDCP for SRB1;
1> re-establish RLC for SRB1;
1> perform the radio resource configuration procedure in accordance with the received radioResourceConfigDedicated and as specified in 5.3.10;
1> resume SRB1;
1> update the $K_{\text{ENB}}$ key based on the $K_{\text{ASME}}$ key to which the current $K_{\text{ENB}}$ is associated, using the $\text{nextHopChainingCount}$ value indicated in the $\text{RRCConnectionReestablishment}$ message, as specified in TS 33.401 [32];
1> store the $\text{nextHopChainingCount}$ value;
1> derive the $K_{\text{RRCint}}$ key associated with the previously configured integrity algorithm, as specified in TS 33.401 [32];
1> derive the $K_{\text{RRCenc}}$ key and the $K_{\text{UPenc}}$ key associated with the previously configured ciphering algorithm, as specified in TS 33.401 [32];
1> configure lower layers to activate integrity protection using the previously configured algorithm and the $K_{\text{RRCint}}$ key immediately, i.e., integrity protection shall be applied to all subsequent messages received and sent by the UE, including the message used to indicate the successful completion of the procedure;
1> configure lower layers to apply ciphering using the previously configured algorithm, the $K_{\text{RRCenc}}$ key and the $K_{\text{UPenc}}$ key immediately, i.e., ciphering shall be applied to all subsequent messages received and sent by the UE, including the message used to indicate the successful completion of the procedure;
1> set the content of $\text{RRCConnectionReestablishmentComplete}$ message as follows:
2> include the $\text{rlf-InfoAvailable}$ and set it to true, if the UE has radio link failure information available that is related to the last occurrence of radio link failure;
1> perform the measurement related actions as specified in 5.5.6.1;
1> submit the $\text{RRCConnectionReestablishmentComplete}$ message to lower layers for transmission, upon which the procedure ends;

5.3.7.6 T311 expiry

Upon T311 expiry, the UE shall:
1> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'RRC connection failure';

5.3.7.7 T301 expiry or selected cell no longer suitable

The UE shall:
1> if timer T301 expires; or
1> if the selected cell becomes no longer suitable according to the cell selection criteria as specified in TS 36.304 [4]:
2> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'RRC connection failure';
5.3.7.8 Reception of *RRCConnectionReestablishmentReject* by the UE

Upon receiving the *RRCConnectionReestablishmentReject* message, the UE shall:

1. perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'RRC connection failure';

5.3.8 RRC connection release

5.3.8.1 General

![Figure 5.3.8.1-1: RRC connection release, successful](image)

The purpose of this procedure is to release the RRC connection, which includes the release of the established radio bearers as well as all radio resources.

5.3.8.2 Initiation

E-UTRAN initiates the RRC connection release procedure to a UE in RRC_CONNECTED.

5.3.8.3 Reception of the *RRCConnectionRelease* by the UE

The UE shall:

1. delay the following actions defined in this sub-clause 60 ms from the moment the *RRCConnectionRelease* message was received or optionally when lower layers indicate that the receipt of the *RRCConnectionRelease* message has been successfully acknowledged, whichever is earlier;

1. if the *RRCConnectionRelease* message includes the *idleModeMobilityControlInfo*:
   2. store the cell reselection priority information provided by the *idleModeMobilityControlInfo*;
   2. if the *t320* is included:
      3. start timer T320, with the timer value set according to the value of *t320*;
   1. else:
      2. apply the cell reselection priority information broadcast in the system information;
   1. if the *releaseCause* received in the *RRCConnectionRelease* message indicates 'loadBalancingTAURequired':
      2. perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'load balancing TAU required';
   1. else:
      2. perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'other';

5.3.8.4 T320 expiry

The UE shall:

1. if T320 expires:
2> if stored, discard the cell reselection priority information provided by the idleModeMobilityControlInfo or inherited from another RAT;

2> apply the cell reselection priority information broadcast in the system information;

5.3.9   RRC connection release requested by upper layers

5.3.9.1   General

The purpose of this procedure is to release the RRC connection. Access to the current cell may be barred as a result of this procedure.

NOTE: Upper layers invoke the procedure, e.g. upon determining that the network has failed an authentication check, see TS 24.301 [35].

5.3.9.2   Initiation

The UE initiates the procedure when upper layers request the release of the RRC connection.

The UE shall:

1> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'other';

1> if the upper layers indicate barring of the serving cell:

2> treat the cell used prior to entering RRC_IDLE as barred according to TS 36.304 [4];

5.3.10   Radio resource configuration

5.3.10.0   General

The UE shall:

1> if the received radioResourceConfigDedicated includes the srb-ToAddModList:

2> perform the SRB addition or reconfiguration as specified in 5.3.10.1;

1> if the received radioResourceConfigDedicated includes the drb-ToReleaseList:

2> perform DRB release as specified in 5.3.10.2;

1> if the received radioResourceConfigDedicated includes the drb-ToAddModList:

2> perform DRB addition or reconfiguration as specified in 5.3.10.3;

1> if the received radioResourceConfigDedicated includes the mac-MainConfig:

2> perform MAC main reconfiguration as specified in 5.3.10.4;

1> if the received radioResourceConfigDedicated includes sps-Config:

2> perform SPS reconfiguration according to 5.3.10.5;

1> if the received radioResourceConfigDedicated includes the physicalConfigDedicated:

2> reconfigure the physical channel configuration as specified in 5.3.10.6;

1> if the received radioResourceConfigDedicated includes the rlf-TimersAndConstants:

2> reconfigure the values of timers and constants as specified in 5.3.10.7;
5.3.10.1 SRB addition/ modification

The UE shall:

1> for each srb-Identity value included in the srb-ToAddModList that is not part of the current UE configuration (SRB establishment):

   2> apply the specified configuration defined in 9.1.2 for the corresponding SRB;

   2> establish a PDCP entity and configure it with the current security configuration, if applicable;

   2> establish an RLC entity in accordance with the received rlc-Config;

   2> establish a DCCH logical channel in accordance with the received logicalChannelConfig and with the logical channel identity set in accordance with 9.1.2;

1> for each srb-Identity value included in the srb-ToAddModList that is part of the current UE configuration (SRB reconfiguration):

   2> reconfigure the RLC entity in accordance with the received rlc-Config;

   2> reconfigure the DCCH logical channel in accordance with the received logicalChannelConfig;

5.3.10.2 DRB release

The UE shall:

1> for each drb-Identity value included in the drb-ToReleaseList that is part of the current UE configuration (DRB release); or

1> for each drb-identity value that is to be released as the result of full configuration option according to 5.3.5.8:

   2> release the PDCP entity;

   2> release the RLC entity or entities;

   2> release the DTCH logical channel;

1> if the procedure was triggered due to handover:

   2> indicate the release of the DRB(s) and the eps-BearerIdentity of the released DRB(s) to upper layers after successful handover;

1> else:

   2> indicate the release of the DRB(s) and the eps-BearerIdentity of the released DRB(s) to upper layers immediately.

NOTE: The UE does not consider the message as erroneous if the drb-ToReleaseList includes any drb-Identity value that is not part of the current UE configuration.

5.3.10.3 DRB addition/ modification

The UE shall:

1> for each drb-Identity value included in the drb-ToAddModList that is not part of the current UE configuration (DRB establishment including the case when full configuration option is used):

   2> establish a PDCP entity and configure it with the current security configuration and in accordance with the received pdcp-Config;

   2> establish an RLC entity or entities in accordance with the received rlc-Config;

   2> establish a DTCH logical channel in accordance with the received logicalChannelIdentity and the received logicalChannelConfig;
1> if the RRCConnectionReconfiguration message includes the fullConfig IE:
   2> associate the established DRB with corresponding included eps-BearerIdentity;
1> else:
   2> indicate the establishment of the DRB(s) and the eps-BearerIdentity of the established DRB(s) to upper layers;
1> for each drb-Identity value included in the drb-ToAddModList that is part of the current UE configuration (DRB reconfiguration):
   2> if the pdcp-Config is included:
      3> reconfigure the PDCP entity in accordance with the received pdcp-Config;
   2> if the rlc-Config is included:
      3> reconfigure the RLC entity or entities in accordance with the received rlc-Config;
   2> if the logicalChannelConfig is included:
      3> reconfigure the DTCH logical channel in accordance with the received logicalChannelConfig;

NOTE: Removal and addition of the same drb-Identity in single radioResourceConfiguration is not supported.

5.3.10.4 MAC main reconfiguration
The UE shall:
   1> reconfigure the MAC main configuration in accordance with the received mac-MainConfig;

5.3.10.5 Semi-persistent scheduling reconfiguration
The UE shall:
   1> reconfigure the semi-persistent scheduling in accordance with the received sps-Config;

5.3.10.6 Physical channel reconfiguration
The UE shall:
   1> reconfigure the physical channel configuration in accordance with the received physicalConfigDedicated;
   1> if the antennaInfo is included and set to 'explicitValue':
      2> if the configured transmissionMode is not 'tm3' or 'tm4' or 'tm8':
         3> release ri-ConfigIndex in cqi-ReportPeriodic, if previously configured;
      2> if the configured transmissionMode is 'tm8' and pmi-RI-Report is not present:
         3> release ri-ConfigIndex in cqi-ReportPeriodic, if previously configured;
   1> else if the antennaInfo is included and set to 'defaultValue':
      2> release ri-ConfigIndex in cqi-ReportPeriodic, if previously configured;

5.3.10.7 Radio Link Failure Timers and Constants reconfiguration
The UE shall:
   1> if the received rlf-TimersAndConstants is set to 'release':
      2> use values for timers T301, T310, T311 and constants N310, N311, as included in ue-TimersAndConstants received in SystemInformationBlockType2;
1> else:
2> reconfigure the value of timers and constants in accordance with received $rlf$-$TimersAndConstants$;

5.3.11 Radio link failure related actions

5.3.11.1 Detection of physical layer problems in RRC_CONNECTED

The UE shall:

1> upon receiving N310 consecutive "out-of-sync" indications from lower layers while neither T300, T301, T304 nor T311 is running:
2> start timer T310;

5.3.11.2 Recovery of physical layer problems

Upon receiving N311 consecutive "in-sync" indications from lower layers while T310 is running, the UE shall:

1> stop timer T310;

NOTE 1: In this case, the UE maintains the RRC connection without explicit signalling, i.e. the UE maintains the entire radio resource configuration.

NOTE 2: Periods in time where neither "in-sync" nor "out-of-sync" is reported by layer 1 do not affect the evaluation of the number of consecutive "in-sync" or "out-of-sync" indications.

5.3.11.3 Detection of radio link failure

The UE shall:

1> upon T310 expiry; or
1> upon random access problem indication from MAC while neither T300, T301, T304 nor T311 is running; or
1> upon indication from RLC that the maximum number of retransmissions has been reached:
2> consider radio link failure to be detected;
2> if AS security has not been activated:
3> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'other';
2> else:
3> initiate the connection re-establishment procedure as specified in 5.3.7;

5.3.12 UE actions upon leaving RRC_CONNECTED

Upon leaving RRC_CONNECTED, the UE shall:

1> reset MAC;
1> stop all timers that are running except T320;
1> release all radio resources, including release of the RLC entity, the MAC configuration and the associated PDCP entity for all established RBs except the MBMS PTM RBs;
1> indicate the release of the RRC connection to upper layers together with the release cause;
1> if leaving RRC_CONNECTED was not triggered by reception of the MobilityFromEUTRACCommand message:
2> enter RRC_IDLE by performing cell selection in accordance with the cell selection process, defined for the case of leaving RRC_CONNECTED, as specified in TS 36.304 [4];
5.3.13 UE actions upon PUCCH/ SRS release request

Upon receiving a PUCCH/ SRS release request from lower layers, the UE shall:

1> apply the default physical channel configuration for CQI-ReportConfig and cqi-Mask if configured as specified in 9.2.4;
1> apply the default physical channel configuration for soundingRS-UL-ConfigDedicated as specified in 9.2.4;
1> apply the default physical channel configuration for schedulingRequestConfig as specified in 9.2.4;

5.3.14 Proximity indication

5.3.14.1 General

The purpose of this procedure is to indicate that the UE is entering or leaving the proximity of one or more cells whose CSG IDs are in the UEs CSG whitelist. The detection of proximity is based on an autonomous search function as defined in TS 36.304 [4].

5.3.14.2 Initiation

A UE in RRC_CONNECTED shall:

1> if the UE enters the proximity of one or more cell(s), whose CSG IDs are in the UEs CSG whitelist, on an E-UTRA frequency while proximity indication is enabled for such E-UTRA cells; or
1> if the UE enters the proximity of one or more cell(s), whose CSG IDs are in the UEs CSG whitelist, on an UTRA frequency while proximity indication is enabled for such UTRA cells; or
1> if the UE leaves the proximity of all cell(s), whose CSG IDs are in the UEs CSG whitelist, on an E-UTRA frequency while proximity indication is enabled for such E-UTRA cells; or
1> if the UE leaves the proximity of all cell(s), whose CSG IDs are in the UEs CSG whitelist, on an UTRA frequency while proximity indication is enabled for such UTRA cells:

2> if the UE has previously not transmitted a ProximityIndication for the RAT and frequency during the current RRC connection, or if more than 5 s has elapsed since the UE has last transmitted a ProximityIndication (either entering or leaving) for the RAT and frequency:

3> initiate transmission of the ProximityIndication message in accordance with 5.3.14.3;

NOTE: In the conditions above, "if the UE enters the proximity of one or more cells whose CSG IDs are in the CSG whitelist" includes the case of already being in the proximity of such cell(s) at the time proximity indication for the corresponding RAT is enabled.

5.3.14.3 Actions related to transmission of ProximityIndication message

The UE shall set the contents of ProximityIndication message as follows:
1> if the UE applies the procedure to report entering the proximity of cell(s) whose CSG IDs are in the UEs CSG whitelist:
2> set type to 'entering';
1> else if the UE applies the procedure to report leaving the proximity of cell(s) whose CSG IDs are in the UEs CSG whitelist:
2> set type to 'leaving';
1> if the proximity indication was triggered for one or more cell(s), whose CSG IDs are in the UEs CSG whitelist, on an E-UTRA frequency:
2> set the carrierFreq to 'eutra' with the value set to the E-ARFCN value of the E-UTRA cell(s) for which proximity indication was triggered;
1> else if the proximity indication was triggered for one or more cell(s), whose CSG IDs are in the UEs CSG whitelist, on a UTRA frequency:
2> set the carrierFreq to 'utra' with the value set to the ARFCN value of the UTRA cell(s) for which proximity indication was triggered;

The UE shall submit the ProximityIndication message to lower layers for transmission.

5.4 Inter-RAT mobility

5.4.1 Introduction

The general principles of connected mode mobility are described in 5.3.1.3. The general principles of the security handling upon connected mode mobility are described in 5.3.1.2.

For the (network controlled) inter RAT mobility from E-UTRA for a UE in RRC_CONNECTED, a single procedure is defined that supports both handover, cell change order with optional network assistance (NACC) and enhanced CS fallback to CDMA2000 1xRTT. In case of mobility to CDMA2000, the eNB decides when to move to the other RAT while the target RAT determines to which cell the UE shall move.

5.4.2 Handover to E-UTRA

5.4.2.1 General

The purpose of this procedure is to, under the control of the network, transfer a connection between the UE and another Radio Access Network (e.g. GERAN or UTRAN) to E-UTRAN.

The handover to E-UTRA procedure applies when SRBs, possibly in combination with DRBs, are established in another RAT. Handover from UTRAN to E-UTRAN applies only after integrity has been activated in UTRAN.
5.4.2.2 Initiation

The RAN using another RAT initiates the Handover to E-UTRA procedure, in accordance with the specifications applicable for the other RAT, by sending the \textit{RRCConnectionReconfiguration} message via the radio access technology from which the inter-RAT handover is performed.

E-UTRAN applies the procedure as follows:

- to activate ciphering, possibly using NULL algorithm, if not yet activated in the other RAT;
- to establish SRB1, SRB2 and one or more DRBs, i.e. at least the DRB associated with the default EPS bearer is established;

5.4.2.3 Reception of the \textit{RRCConnectionReconfiguration} by the UE

If the UE is able to comply with the configuration included in the \textit{RRCConnectionReconfiguration} message, the UE shall:

1. apply the default physical channel configuration as specified in 9.2.4;
2. apply the default semi-persistent scheduling configuration as specified in 9.2.3;
3. apply the default MAC main configuration as specified in 9.2.2;
4. start timer T304 with the timer value set to $t_{304}$, as included in the \textit{mobilityControlInfo};
5. consider the target cell to be one on the frequency indicated by the \textit{carrierFreq} with a physical cell identity indicated by the \textit{targetPhysCellId};
6. start synchronising to the DL of the target cell;
7. set the C-RNTI to the value of the \textit{newUE-Identity};
8. for the target cell, apply the downlink bandwidth indicated by the \textit{dl-Bandwidth};
9. for the target cell, apply the uplink bandwidth indicated by (the absence or presence of) the \textit{ul-Bandwidth};
10. perform the radio resource configuration procedure as specified in 5.3.10;
11. forward the \textit{nas-SecurityParamToEUTRA} to the upper layers;
12. derive the K_{eNB} key, as specified in TS 33.401 [32];
13. derive the K_{\text{RRCint}} key associated with the \textit{integrityProtAlgorithm}, as specified in TS 33.401 [32];
14. derive the K_{\text{RRCenc}} key and the K_{\text{UPenc}} key associated with the \textit{cipheringAlgorithm}, as specified in TS 33.401 [32];
15. configure lower layers to apply the indicated integrity protection algorithm and the K_{\text{RRCint}} key immediately, i.e. the indicated integrity protection configuration shall be applied to all subsequent messages received and sent by the UE, including the message used to indicate the successful completion of the procedure;
16. configure lower layers to apply the indicated ciphering algorithm, the K_{\text{RRCenc}} key and the K_{\text{UPenc}} key immediately, i.e. the indicated ciphering configuration shall be applied to all subsequent messages received and sent by the UE, including the message used to indicate the successful completion of the procedure;
17. if the \textit{RRCConnectionReconfiguration} message includes the \textit{measConfig}:
   1. perform the measurement configuration procedure as specified in 5.5.2;
18. if the \textit{RRCConnectionReconfiguration} message includes the \textit{reportProximityConfig}:
   1. perform the proximity indication configuration in accordance with the received \textit{reportProximityConfig};
19. submit the \textit{RRCConnectionReconfigurationComplete} message to lower layers for transmission using the new configuration;
20. if the \textit{RRCConnectionReconfiguration} message does not include the \textit{rlf-TimersAndConstants}:
2. use the default values specified in 9.2.5 for timer T310, T311 and constant N310, N311;

1. if MAC successfully completes the random access procedure:
   2. stop timer T304;
   2. apply the parts of the CQI reporting configuration, the scheduling request configuration and the sounding RS configuration that do not require the UE to know the SFN of the target cell, if any;
   2. apply the parts of the measurement and the radio resource configuration that require the UE to know the SFN of the target cell (e.g. measurement gaps, periodic CQI reporting, scheduling request configuration, sounding RS configuration), if any, upon acquiring the SFN of the target cell;
   2. enter E-UTRA RRC_CONNECTED, upon which the procedure ends;

5.4.2.4  Reconfiguration failure

The UE shall:

1. if the UE is unable to comply with (part of) the configuration included in the RRCConnectionReconfiguration message:
   2. perform the actions defined for this failure case as defined in the specifications applicable for the other RAT;

NOTE 1: The UE may apply above failure handling also in case the RRCConnectionReconfiguration message causes a protocol error for which the generic error handling as defined in 5.7 specifies that the UE shall ignore the message.

NOTE 2: If the UE is unable to comply with part of the configuration, it does not apply any part of the configuration, i.e. there is no partial success/failure.

5.4.2.5  T304 expiry (handover to E-UTRA failure)

The UE shall:

1. upon T304 expiry (handover to E-UTRA failure):
   2. reset MAC;
   2. perform the actions defined for this failure case as defined in the specifications applicable for the other RAT;

5.4.3  Mobility from E-UTRA

5.4.3.1 General

```
UE

MobilityFromEUTRACCommand

EUTRAN
```

Figure 5.4.3.1-1: Mobility from E-UTRA, successful
Figure 5.4.3.1-2: Mobility from E-UTRA, failure

The purpose of this procedure is to move a UE in RRC_CONNECTED to a cell using another Radio Access Technology (RAT), e.g. GERAN, UTRA or CDMA2000 systems. The mobility from E-UTRA procedure covers the following type of mobility:

- handover, i.e. the MobilityFromEUTRACCommand message includes radio resources that have been allocated for the UE in the target cell;
- cell change order, i.e. the MobilityFromEUTRACCommand message may include information facilitating access of and/or connection establishment in the target cell, e.g. system information. Cell change order is applicable only to GERAN; and
- enhanced CS fallback to CDMA2000 1xRTT, i.e. the MobilityFromEUTRACCommand message includes radio resources that have been allocated for the UE in the target cell. The enhanced CS fallback to CDMA2000 1xRTT may be combined with concurrent handover or redirection to CDMA2000 HRPD.

5.4.3.2 Initiation

E-UTRAN initiates the mobility from E-UTRA procedure to a UE in RRC_CONNECTED, possibly in response to a MeasurementReport message or in response to reception of CS fallback indication for the UE from MME, by sending a MobilityFromEUTRACCommand message. E-UTRAN applies the procedure as follows:

- the procedure is initiated only when AS-security has been activated, and SRB2 with at least one DRB are setup and not suspended;

5.4.3.3 Reception of the MobilityFromEUTRACCommand by the UE

The UE shall be able to receive a MobilityFromEUTRACCommand message and perform a cell change order to GERAN, even if no prior UE measurements have been performed on the target cell.

The UE shall:

1> stop timer T310, if running;
2> if the MobilityFromEUTRACCommand message includes the purpose set to 'handover':
   3> if the targetRAT-Type is set to 'utra' or 'geran':
      4> consider inter-RAT mobility as initiated towards the RAT indicated by the targetRAT-Type included in the MobilityFromEUTRACCommand message;
      3> forward the nas-SecurityParamFromEUTRA to the upper layers;
      3> access the target cell indicated in the inter-RAT message in accordance with the specifications of the target RAT;
      3> if the targetRAT-Type is set to 'geran':
         4> use the contents of systemInformation, if provided for PS Handover, as the system information to begin access on the target GERAN cell;
NOTE 1: If there are DRBs for which no radio bearers are established in the target RAT as indicated in the targetRAT-MessageContainer in the message, the E-UTRA RRC part of the UE does not indicate the release of the concerned DRBs to the upper layers. Upper layers may derive which bearers are not established from information received from the AS of the target RAT.

2> else if the targetRAT-Type is set to 'cdma2000-1XRTT' or 'cdma2000-HRPD':
   3> forward the targetRAT-Type and the targetRAT-MessageContainer to the CDMA2000 upper layers for the UE to access the cell(s) indicated in the inter-RAT message in accordance with the specifications of the CDMA2000 target-RAT;

1> else if the MobilityFromEUTRACCommand message includes the purpose set to 'cellChangeOrder':
   2> start timer T304 with the timer value set to t304, as included in the MobilityFromEUTRACCommand message;
   2> if the targetRAT-Type is set to 'geran':
      3> if networkControlOrder is included in the MobilityFromEUTRACCommand message:
         4> apply the value as specified in TS 44.060 [36];
      3> else:
         4> acquire networkControlOrder and apply the value as specified in TS 44.060 [36];
      3> use the contents of systemInformation, if provided, as the system information to begin access on the target GERAN cell;

NOTE 2: The systemInformation is constructed in the same way as in 2G to 2G NACC, i.e. the PSI messages are encoded as such, whereas the SI messages exclude 2 octets of headers, see TS 44.060[36].

2> establish the connection to the target cell indicated in the CellChangeOrder;

NOTE 3: The criteria for success or failure of the cell change order to GERAN are specified in TS 44.060[36].

1> if the MobilityFromEUTRACCommand message includes the purpose set to 'e-CSFB':
   2> if messageContCDMA2000-1XRTT is present:
      3> forward the messageContCDMA2000-1XRTT to the CDMA2000 upper layers for the UE to access the cell(s) indicated in the inter-RAT message in accordance with the specification of the target RAT;
   2> if mobilityCDMA2000-HRPD is present and is set to 'handover':
      3> forward the messageContCDMA2000-HRPD to the CDMA2000 upper layers for the UE to access the cell(s) indicated in the inter-RAT message in accordance with the specification of the target RAT;
   2> if mobilityCDMA2000-HRPD is present and is set to 'redirection':
      3> forward the redirectedCarrierInfoCDMA2000-HRPD to the CDMA2000 upper layers;

NOTE 4: When the CDMA2000 upper layers in the UE receive both the messageContCDMA2000-1XRTT and messageContCDMA2000-HRPD the UE performs concurrent access to both CDMA2000 1xRTT and CDMA2000 HRPD RAT.

5.4.3.4 Successful completion of the mobility from E-UTRA

Upon successfully completing the handover, the cell change order or enhanced 1xRTT CS fallback, the UE shall:

1> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'other';
1> stop timer T304, if running;

NOTE: If the UE performs enhanced 1xRTT CS fallback along with concurrent mobility to CDMA2000 HRPD and the connection to either CDMA2000 1xRTT or CDMA2000 HRPD succeeds, then the mobility from E-UTRA is considered successful.
5.4.3.5 Mobility from E-UTRA failure

The UE shall:

1> if T304 expires (mobility from E-UTRA failure); or

1> if the UE does not succeed in establishing the connection to the target radio access technology; or

1> if the UE is unable to comply with (part of) the configuration included in the MobilityFromEUTRACmd message; or

1> if there is a protocol error in the inter RAT information included in the MobilityFromEUTRACmd message, causing the UE to fail the procedure according to the specifications applicable for the target RAT:

2> stop T304, if running;

2> if the cs-FallbackIndicator in the MobilityFromEUTRACmd message was set to 'TRUE':

3> indicate to upper layers that the CS Fallback procedure has failed;

2> revert back to the configuration used in the source cell, excluding the configuration configured by the physicalConfigDedicated, mac(MainConfig and sps-Config;

2> initiate the connection re-establishment procedure as specified in 5.3.7;

NOTE: For enhanced CS fallback to CDMA2000 1xRTT, the above UE behavior applies only when the UE is attempting the enhanced 1xRTT CS fallback and connection to the target radio access technology fails or if the UE is attempting enhanced 1xRTT CS fallback along with concurrent mobility to CDMA2000 HRPD and connection to both the target radio access technologies fails.

5.4.4 Handover from E-UTRA preparation request (CDMA2000)

5.4.4.1 General

The purpose of this procedure is to trigger the UE to prepare for handover or enhanced 1xRTT CS fallback to CDMA2000 by requesting a connection with this network. The UE may use this procedure to concurrently prepare for handover to CDMA2000 HRPD along with preparation for enhanced CS fallback to CDMA2000 1xRTT. This procedure applies to CDMA2000 capable UEs only.

The handover from E-UTRA preparation request procedure applies when signalling radio bearers are established.

5.4.4.2 Initiation

E-UTRAN initiates the handover from E-UTRA preparation request procedure to a UE in RRC_CONNECTED, possibly in response to a MeasurementReport message or CS fallback indication for the UE, by sending a HandoverFromEUTRAPreparationRequest message. E-UTRA initiates the procedure only when AS security has been activated.

5.4.4.3 Reception of the HandoverFromEUTRAPreparationRequest by the UE

Upon reception of the HandoverFromEUTRAPreparationRequest message, the UE shall:
1> indicate the request to prepare handover or enhanced 1xRTT CS fallback and forward the cdma2000-Type to the CDMA2000 upper layers;

1> if cdma2000-Type is set to 'type1XRTT':

2> forward the rand and the mobilityParametersCDMA2000 to the CDMA2000 upper layers;

1> if concurrPrepCDMA2000-HRPD is present in the received message:

2> forward concurrPrepCDMA2000-HRPD to the CDMA2000 upper layers;

1> else

2> forward concurrPrepCDMA2000-HRPD, with its value set to FALSE, to the CDMA2000 upper layers;

5.4.5  UL handover preparation transfer (CDMA2000)

5.4.5.1  General

![Diagram](attachment:image.png)

Figure 5.4.5.1-1: UL handover preparation transfer

The purpose of this procedure is to tunnel the handover related CDMA2000 dedicated information or enhanced 1xRTT CS fallback related CDMA2000 dedicated information from UE to E-UTRAN when requested by the higher layers. The procedure is triggered by the higher layers on receipt of HandoverFromEUTRAPreparationRequest message. If preparing for enhanced CS fallback to CDMA2000 1xRTT and handover to CDMA2000 HRPD, the UE sends two consecutive ULHandoverPreparationTransfer messages to E-UTRAN, one per addressed CDMA2000 RAT Type. This procedure applies to CDMA2000 capable UEs only.

5.4.5.2  Initiation

A UE in RRC_CONNECTED initiates the UL Handover Preparation Transfer procedure whenever there is a need to transfer handover or enhanced 1xRTT CS fallback related non-3GPP dedicated information. The UE initiates the UL handover preparation transfer procedure by sending the ULHandoverPreparationTransfer message.

5.4.5.3  Actions related to transmission of the ULHandoverPreparationTransfer message

The UE shall set the contents of the ULHandoverPreparationTransfer message as follows:

1> include the cdma2000-Type and the dedicatedInfoCDMA2000;

1> if the cdma2000-Type is set to 'type1XRTT':

2> include the meid and set it to the value received from the CDMA2000 upper layers;

1> submit the ULHandoverPreparationTransfer message to lower layers for transmission, upon which the procedure ends;

5.4.5.4  Failure to deliver the ULHandoverPreparationTransfer message

The UE shall:

1> if the UE is unable to guarantee successful delivery of ULHandoverPreparationTransfer messages:
2> inform upper layers about the possible failure to deliver the information contained in the concerned ULHandoverPreparationTransfer message;

5.4.6 Inter-RAT cell change order to E-UTRAN

5.4.6.1 General

The purpose of the inter-RAT cell change order to E-UTRAN procedure is to transfer, under the control of the source radio access technology, a connection between the UE and another radio access technology (e.g. GSM/ GPRS) to E-UTRAN.

5.4.6.2 Initiation

The procedure is initiated when a radio access technology other than E-UTRAN, e.g. GSM/GPRS, using procedures specific for that RAT, orders the UE to change to an E-UTRAN cell. In response, upper layers request the establishment of an RRC connection as specified in subclause 5.3.3.

NOTE: Within the message used to order the UE to change to an E-UTRAN cell, the source RAT should specify the identity of the target E-UTRAN cell as specified in the specifications for that RAT.

The UE shall:

1> upon receiving an RRCConnectionSetup message:

2> consider the inter-RAT cell change order procedure to have completed successfully;

5.4.6.3 UE fails to complete an inter-RAT cell change order

If the inter-RAT cell change order fails the UE shall return to the other radio access technology and proceed as specified in the appropriate specifications for that RAT.

The UE shall:

1> upon failure to establish the RRC connection as specified in subclause 5.3.3:

2> consider the inter-RAT cell change order procedure to have failed;

NOTE: The cell change was network ordered. Therefore, failure to change to the target cell should not cause the UE to move to UE-controlled cell selection.

5.5 Measurements

5.5.1 Introduction

The UE reports measurement information in accordance with the measurement configuration as provided by E-UTRAN. E-UTRAN provides the measurement configuration applicable for a UE in RRC_CONNECTED by means of dedicated signalling, i.e. using the RRCConnectionReconfiguration message.

The UE can be requested to perform the following types of measurements:

- Intra-frequency measurements: measurements at the downlink carrier frequency of the serving cell.
- Inter-frequency measurements: measurements at frequencies that differ from the downlink carrier frequency of the serving cell.
- Inter-RAT measurements of UTRA frequencies.
- Inter-RAT measurements of GERAN frequencies.
- Inter-RAT measurements of CDMA2000 HRPD or CDMA2000 1xRTT frequencies.

The measurement configuration includes the following parameters:
1. **Measurement objects:** The objects on which the UE shall perform the measurements.
   - For intra-frequency and inter-frequency measurements a measurement object is a single E-UTRA carrier frequency. Associated with this carrier frequency, E-UTRAN can configure a list of cell specific offsets and a list of 'blacklisted' cells. Blacklisted cells are not considered in event evaluation or measurement reporting.
   - For inter-RAT UTRA measurements a measurement object is a set of cells on a single UTRA carrier frequency.
   - For inter-RAT GERAN measurements a measurement object is a set of GERAN carrier frequencies.
   - For inter-RAT CDMA2000 measurements a measurement object is a set of cells on a single (HRPD or 1xRTT) carrier frequency.

**NOTE 1:** Some measurements using the above mentioned measurement objects, only concern a single cell, e.g. measurements used to report neighbouring cell system information, serving cell UE Rx-Tx time difference.

2. **Reporting configurations:** A list of reporting configurations where each reporting configuration consists of the following:
   - Reporting criterion: The criterion that triggers the UE to send a measurement report. This can either be periodical or a single event description.
   - Reporting format: The quantities that the UE includes in the measurement report and associated information (e.g. number of cells to report).

3. **Measurement identities:** A list of measurement identities where each measurement identity links one measurement object with one reporting configuration. By configuring multiple measurement identities it is possible to link more than one measurement object to the same reporting configuration, as well as to link more than one reporting configuration to the same measurement object. The measurement identity is used as a reference number in the measurement report.

4. **Quantity configurations:** One quantity configuration is configured per RAT type. The quantity configuration defines the measurement quantities and associated filtering used for all event evaluation and related reporting of that measurement type. One filter can be configured per measurement quantity.

5. **Measurement gaps:** Periods that the UE may use to perform measurements, i.e. no (UL, DL) transmissions are scheduled.

E-UTRAN only configures a single measurement object for a given frequency, i.e. it is not possible to configure two or more measurement objects for the same frequency with different associated parameters, e.g. different offsets and/or blacklists. E-UTRAN may configure multiple instances of the same event e.g. by configuring two reporting configurations with different thresholds.

The UE maintains a single measurement object list, a single reporting configuration list, and a single measurement identities list. The measurement object list includes measurement objects, that are specified per RAT type, possibly including an intra-frequency object (i.e. the object corresponding to the serving frequency), inter-frequency object(s) and inter-RAT objects. Similarly, the reporting configuration list includes E-UTRA and inter-RAT reporting configurations. Any measurement object can be linked to any reporting configuration of the same RAT type. Some reporting configurations may not be linked to a measurement object. Likewise, some measurement objects may not be linked to a reporting configuration.

The measurement procedures distinguish the following types of cells:

1. The serving cell.

2. Listed cells - these are cells listed within the measurement object(s).

3. Detected cells - these are cells that are not listed within the measurement object(s) but are detected by the UE on the carrier frequency(ies) indicated by the measurement object(s).

For E-UTRA, the UE measures and reports on the serving cell, listed cells and detected cells. For inter-RAT UTRA, the UE measures and reports on listed cells and optionally on cells that are within a range for which reporting is allowed by E-UTRAN. For inter-RAT GERAN, the UE measures and reports on detected cells. For inter-RAT CDMA2000, the UE measures and reports on listed cells.
NOTE 2: For inter-RAT UTRA and CDMA2000, the UE measures and reports also on detected cells for the purpose of SON.

NOTE 3: This specification is based on the assumption that typically CSG cells of home deployment type are not indicated within the neighbour list. Furthermore, the assumption is that for non-home deployments, the physical cell identity is unique within the area of a large macro cell (i.e. as for UTRAN).

Whenever the procedural specification, other than contained in sub-clause 5.5.2, refers to a field it concerns a field included in the VarMeasConfig unless explicitly stated otherwise i.e. only the measurement configuration procedure covers the direct UE action related to the received measConfig.

5.5.2 Measurement configuration

5.5.2.1 General

E-UTRAN applies the procedure as follows:

- to ensure that, whenever the UE has a measConfig, it includes a measObject for the serving frequency;
- to configure at most one measurement identity using a reporting configuration with the purpose set to ‘reportCGI’;

The UE shall:

1> if the received measConfig includes the measObjectToRemoveList:
   2> perform the measurement object removal procedure as specified in 5.5.2.4;
1> if the received measConfig includes the measObjectToAddModList:
   2> perform the measurement object addition/ modification procedure as specified in 5.5.2.5;
1> if the received measConfig includes the reportConfigToRemoveList:
   2> perform the reporting configuration removal procedure as specified in 5.5.2.6;
1> if the received measConfig includes the reportConfigToAddModList:
   2> perform the reporting configuration addition/ modification procedure as specified in 5.5.2.7;
1> if the received measConfig includes the quantityConfig:
   2> perform the quantity configuration procedure as specified in 5.5.2.8;
1> if the received measConfig includes the measIdToRemoveList:
   2> perform the measurement identity removal procedure as specified in 5.5.2.2;
1> if the received measConfig includes the measIdToAddModList:
   2> perform the measurement identity addition/ modification procedure as specified in 5.5.2.3;
1> if the received measConfig includes the measGapConfig:
   2> perform the measurement gap configuration procedure as specified in 5.5.2.9;
1> if the received measConfig includes the s-Measure:
   2> set the parameter s-Measure within VarMeasConfig to the lowest value of the RSRP ranges indicated by the received value of s-Measure;
1> if the received measConfig includes the preRegistrationInfoHRPD:
   2> forward the preRegistrationInfoHRPD to CDMA2000 upper layers;
1> if the received measConfig includes the speedStatePars:
2> set the parameter `speedStatePars` within `VarMeasConfig` to the received value of `speedStatePars`;

### 5.5.2.2 Measurement identity removal

The UE shall:

1> for each `measId` included in the received `measIdToRemoveList` that is part of the current UE configuration in `VarMeasConfig`:

2> remove the entry with the matching `measId` from the `measIdList` within the `VarMeasConfig`;

2> remove the measurement reporting entry for this `measId` from the `VarMeasReportList`, if included;

2> stop the periodical reporting timer or timer T321, whichever one is running, and reset the associated information (e.g. `timeToTrigger`) for this `measId`;

**NOTE:** The UE does not consider the message as erroneous if the `measIdToRemoveList` includes any `measId` value that is not part of the current UE configuration.

### 5.5.2.3 Measurement identity addition/modification

E-UTRAN applies the procedure as follows:

- configure a `measId` only if the corresponding measurement object, the corresponding reporting configuration and the corresponding quantity configuration, are configured;

The UE shall:

1> for each `measId` included in the received `measIdToAddModList`:

2> if an entry with the matching `measId` exists in the `measIdList` within the `VarMeasConfig`:

3> replace the entry with the value received for this `measId`;

2> else:

3> add a new entry for this `measId` within the `VarMeasConfig`;

2> remove the measurement reporting entry for this `measId` from the `VarMeasReportList`, if included;

2> stop the periodical reporting timer or timer T321, whichever one is running, and reset the associated information (e.g. `timeToTrigger`) for this `measId`;

2> if the `triggerType` is set to 'periodical' and the `purpose` is set to 'reportCGI' in the `reportConfig` associated with this `measId`:

3> if the `measObject` associated with this `measId` concerns E-UTRA:

   4> if the `si-RequestForHO` is included in the `reportConfig` associated with this `measId`:

      5> start timer T321 with the timer value set to [150] ms for this `measId`;

   4> else:

      5> start timer T321 with the timer value set to 1 second for this `measId`;

3> else if the `measObject` associated with this `measId` concerns UTRA:

   4> if the `si-RequestForHO` is included in the `reportConfig` associated with this `measId`:

      5> start timer T321 with the timer value set to [FFS] for this `measId`;

   4> else:

      5> start timer T321 with the timer value set to 8 seconds for this `measId`;

3> else:

3GPP
4> start timer T321 with the timer value set to 8 seconds for this measId;

5.5.2.4 Measurement object removal

The UE shall:

1> for each measObjectId included in the received measObjectToRemoveList that is part of the current UE configuration in varMeasConfig:

2> remove the entry with the matching measObjectId from the measObjectList within the VarMeasConfig;

2> remove all measId associated with this measObjectId from the measIdList within the VarMeasConfig, if any;

2> if a measId is removed from the measIdList:

3> remove the measurement reporting entry for this measId from the VarMeasReportList, if included;

3> stop the periodical reporting timer or timer T321, whichever one is running, and reset the associated information (e.g. timeToTrigger) for this measId;

NOTE: The UE does not consider the message as erroneous if the measObjectToRemoveList includes any measObjectId value that is not part of the current UE configuration.

5.5.2.5 Measurement object addition/ modification

The UE shall:

1> for each measObjectId included in the received measObjectToAddModList:

2> if an entry with the matching measObjectId exists in the measObjectList within the VarMeasConfig, for this entry:

3> replace the entry with the value received for this measObject, except for the fields cellsToAddModList, blackCellsToAddModList, cellsToRemoveList and blackCellsToRemoveList:

3> if the received measObject includes the cellsToRemoveList:

4> for each cellIndex included in the cellsToRemoveList:

5> remove the entry with the matching cellIndex from the cellsToAddModList;

3> if the received measObject includes the cellsToAddModList:

4> for each cellIndex value included in the cellsToAddModList:

5> if an entry with the matching cellIndex exists in the cellsToAddModList:

6> replace the entry with the value received for this cellIndex;

5> else:

6> add a new entry for the received cellIndex to the cellsToAddModList;

3> if the received measObject includes the blackCellsToRemoveList:

4> for each cellIndex included in the blackCellsToRemoveList:

5> remove the entry with the matching cellIndex from the blackCellsToAddModList;

3> if the received measObject includes the blackCellsToAddModList:

4> for each cellIndex included in the blackCellsToAddModList:

5> if an entry with the matching cellIndex is included in the blackCellsToAddModList:

6> replace the entry with the value received for this cellIndex;
5> else:
6> add a new entry for the received cellIndex to the blackCellsToAddModList;
3> for each measId associated with this measObjectId in the measIdList within the VarMeasConfig, if any:
4> remove the measurement reporting entry for this measId from the VarMeasReportList, if included;
4> stop the periodical reporting timer or timer T321, whichever one is running, and reset the associated information (e.g. timeToTrigger) for this measId;
2> else:
3> add a new entry for the received measObject to the measObjectList within VarMeasConfig;

5.5.2.6 Reporting configuration removal

The UE shall:

1> for each reportConfigId included in the received reportConfigToRemoveList that is part of the current UE configuration in varMeasConfig:
2> remove the entry with the matching reportConfigId from the reportConfigList within the VarMeasConfig;
2> remove all measId associated with the reportConfigId from the measIdList within the VarMeasConfig, if any;
2> if a measId is removed from the measIdList:
3> remove the measurement reporting entry for this measId from the VarMeasReportList, if included;
3> stop the periodical reporting timer or timer T321, whichever one is running, and reset the associated information (e.g. timeToTrigger) for this measId;

NOTE: The UE does not consider the message as erroneous if the reportConfigToRemoveList includes any reportConfigId value that is not part of the current UE configuration.

5.5.2.7 Reporting configuration addition/ modification

The UE shall:

1> for each reportConfigId included in the received reportConfigToAddModList:
2> if an entry with the matching reportConfigId exists in the reportConfigList within the VarMeasConfig, for this entry:
3> replace the entry with the value received for this reportConfig;
3> for each measId associated with this reportConfigId included in the measIdList within the VarMeasConfig, if any:
4> remove the measurement reporting entry for this measId from in VarMeasReportList, if included;
4> stop the periodical reporting timer or timer T321, whichever one is running, and reset the associated information (e.g. timeToTrigger) for this measId;
2> else:
3> add a new entry for the received reportConfig to the reportConfigList within the VarMeasConfig;

5.5.2.8 Quantity configuration

The UE shall:

1> set the parameter quantityConfig within VarMeasConfig to the received value of quantityConfig;
1> for each measId included in the measIdList within VarMeasConfig:
2> remove the measurement reporting entry for this measId from the VarMeasReportList, if included;
2> stop the periodical reporting timer or timer T321, whichever one is running, and reset the associated information (e.g. timeToTrigger) for this measId;

5.5.2.9 Measurement gap configuration

The UE shall:

1> if measGapConfig is set to 'setup':
2> if a measurement gap configuration is already setup, release the measurement gap configuration;
2> setup the measurement gap configuration indicated by the measGapConfig in accordance with the received gapOffset, i.e., each gap starts at an SFN and subframe meeting the following condition:

- SFN mod T = FLOOR(gapOffset/10);
- subframe = gapOffset mod 10;

with T = MGRP/10 as defined in TS 36.133 [16];
1> else:
2> release the measurement gap configuration;

5.5.3 Performing measurements

5.5.3.1 General

For all measurements the UE applies the layer 3 filtering as specified in 5.5.3.2, before using the measured results for evaluation of reporting criteria or for measurement reporting.

The UE shall:

1> for each measId included in the measIdList within VarMeasConfig:
2> if the purpose for the associated reportConfig is set to 'reportCGI':
3> if si-RequestForHO is configured for the associated reportConfig:
4> perform the corresponding measurements on the frequency and RAT indicated in the associated measObject using autonomous gaps as necessary;
3> else:
4> perform the corresponding measurements on the frequency and RAT indicated in the associated measObject using available idle periods or using autonomous gaps as necessary;

NOTE 1: If autonomous gaps are used to perform measurements, the UE is allowed to temporarily abort communication with the serving cell, i.e. create autonomous gaps to perform the corresponding measurements within the limits specified in TS 36.133 [16]. Otherwise, the UE only supports the measurements with the purpose set to 'reportCGI' only if E-UTRAN has provided sufficient idle periods.
3> try to acquire the global cell identity of the cell indicated by the cellForWhichToReportCGI in the associated measObject by acquiring the relevant system information from the concerned cell;
3> if the cell indicated by the cellForWhichToReportCGI included in the associated measObject is an E-UTRAN cell:
4> try to acquire the CSG identity, if the CSG identity is broadcast in the concerned cell;
4> if si-RequestForHO is not configured for the associated reportConfig:
5> try to acquire the list of additional PLMN Identities, as included in the plmn-IdentityList, if multiple PLMN identities are broadcast in the concerned cell;

NOTE 2: The 'primary' PLMN is part of the global cell identity.

3> if the cell indicated by the cellForWhichToReportCGI included in the associated measObject is a UTRAN cell:
   4> try to acquire the LAC, the RAC and the list of additional PLMN Identities, if multiple PLMN identities are broadcast in the concerned cell;
   4> try to acquire the CSG identity, if the CSG identity is broadcast in the concerned cell;
3> if the cell indicated by the cellForWhichToReportCGI included in the associated measObject is a GERAN cell:
   4> try to acquire the RAC in the concerned cell;
3> if the cell indicated by the cellForWhichToReportCGI included in the associated measObject is a CDMA2000 cell and the cdma2000-Type included in the measObject is 'typeHRPD':
   4> try to acquire the Sector ID in the concerned cell;
3> if the cell indicated by the cellForWhichToReportCGI included in the associated measObject is a CDMA2000 cell and the cdma2000-Type included in the measObject is 'type1XRTT':
   4> try to acquire the BASE ID, SID and NID in the concerned cell;

2> else:
3> if a measurement gap configuration is setup; or
3> if the UE does not require measurement gaps to perform the concerned measurements:
   4> if s-Measure is not configured; or
   4> if s-Measure is configured and the serving cell RSRP, after layer 3 filtering, is lower than this value:
      5> perform the corresponding measurements of neighbouring cells on the frequencies and RATs indicated in the concerned measObject;
   4> if the ue-RxTxTimeDiffPeriodical is configured in the associated reportConfig:
      5> perform the UE Rx – Tx time difference measurements on the serving cell;
2> perform the evaluation of reporting criteria as specified in 5.5.4;

NOTE 3: The 's-Measure' defines when the UE is required to perform measurements. The UE is however allowed to perform measurements also when the serving cell RSRP exceeds 's-Measure', e.g., to measure cells broadcasting a CSG identity following use of the autonomous search function as defined in TS 36.304 [4].

5.5.3.2 Layer 3 filtering

The UE shall:

1> for each measurement quantity that the UE performs measurements according to 5.5.3.1:

NOTE 1: This does not include quantities configured solely for UE Rx- Tx time difference measurements i.e. for those type of measurements the UE ignores the triggerQuantity and reportQuantity.

2> filter the measured result, before using for evaluation of reporting criteria or for measurement reporting, by the following formula:

\[ F_n = (1 - a) \cdot F_{n-1} + a \cdot M_n \]
where

\( M_n \) is the latest received measurement result from the physical layer;

\( F_n \) is the updated filtered measurement result, that is used for evaluation of reporting criteria or for measurement reporting;

\( F_{n-1} \) is the old filtered measurement result, where \( F_0 \) is set to \( M_1 \) when the first measurement result from the physical layer is received; and

\[ a = \frac{1}{2^{k/4}}, \] where \( k \) is the filterCoefficient for the corresponding measurement quantity received by the quantityConfig;

2> adapt the filter such that the time characteristics of the filter are preserved at different input rates, observing that the filterCoefficient \( k \) assumes a sample rate equal to 200 ms;

NOTE 2: If \( k \) is set to 0, no layer 3 filtering is applicable.

NOTE 3: The filtering is performed in the same domain as used for evaluation of reporting criteria or for measurement reporting, i.e., logarithmic filtering for logarithmic measurements.

NOTE 4: The filter input rate is implementation dependent, to fulfil the performance requirements set in [16]. For further details about the physical layer measurements, see TS 36.133 [16].

5.5.4 Measurement report triggering

5.5.4.1 General

The UE shall:

1> for each \( \text{measId} \) included in the \( \text{measIdList} \) within \( \text{VarMeasConfig} \):

2> if the corresponding \( \text{reportConfig} \) includes a purpose set to 'reportStrongestCellsForSON':

3> consider any neighbouring cell detected on the associated frequency to be applicable;

2> else if the corresponding \( \text{reportConfig} \) includes a purpose set to 'reportCGI':

3> consider any neighbouring cell detected on the associated frequency/ set of frequencies (GERAN) which has a physical cell identity matching the value of the \( \text{cellForWhichToReportCGI} \) included in the corresponding \( \text{measObject} \) within the \( \text{VarMeasConfig} \) to be applicable;

2> else:

3> if the corresponding \( \text{measObject} \) concerns E-UTRA:

4> if the \( \text{ue-RxTxTimeDiffPeriodical}, \text{eventA1} \) or \( \text{eventA2} \) is configured in the corresponding \( \text{reportConfig} \):

5> consider only the serving cell to be applicable;

4> else:

5> consider any neighbouring cell detected on the associated frequency to be applicable when the concerned cell is not included in the \( \text{blackCellsToAddModList} \) defined within the \( \text{VarMeasConfig} \) for this \( \text{measId} \);

3> else if the corresponding \( \text{measObject} \) concerns UTRA or CDMA2000:

4> consider a neighbouring cell on the associated frequency to be applicable when the concerned cell is included in the \( \text{cellsToAddModList} \) defined within the \( \text{VarMeasConfig} \) for this \( \text{measId} \) (i.e. the cell is included in the white-list);
NOTE 0: The UE may also consider a neighbouring cell on the associated UTRA frequency to be applicable when the concerned cell is included in the csg-allowedReportingCells within the VarMeasConfig for this measId, if configured in the corresponding measObjectUTRA (i.e. the cell is included in the range of physical cell identities for which reporting is allowed).

else if the corresponding measObject concerns GERAN:

consider a neighbouring cell on the associated set of frequencies to be applicable when the concerned cell matches the ncc-Permitted defined within the VarMeasConfig for this measId;

if the triggerType is set to 'event' and if the entry condition applicable for this event, i.e. the event corresponding with the eventId of the corresponding reportConfig within VarMeasConfig, is fulfilled for one or more applicable cells for all measurements after layer 3 filtering taken during timeToTrigger defined for this event within the VarMeasConfig, while the VarMeasReportList does not include an measurement reporting entry for this measId (a first cell triggers the event):

include a measurement reporting entry within the VarMeasReportList for this measId;

set the numberOfReportsSent defined within the VarMeasReportList for this measId to 0;

include the concerned cell(s) in the cellsTriggeredList defined within the VarMeasReportList for this measId;

initiate the measurement reporting procedure, as specified in 5.5.5;

if the triggerType is set to 'event' and if the entry condition applicable for this event, i.e. the event corresponding with the eventId of the corresponding reportConfig within VarMeasConfig, is fulfilled for one or more applicable cells not included in the cellsTriggeredList for all measurements after layer 3 filtering taken during timeToTrigger defined for this event within the VarMeasConfig (a subsequent cell triggers the event):

set the numberOfReportsSent defined within the VarMeasReportList for this measId to 0;

include the concerned cell(s) in the cellsTriggeredList defined within the VarMeasReportList for this measId;

initiate the measurement reporting procedure, as specified in 5.5.5;

if the triggerType is set to 'event' and if the leaving condition applicable for this event is fulfilled for one or more of the cells included in the cellsTriggeredList defined within the VarMeasReportList for this measId for all measurements after layer 3 filtering taken during timeToTrigger defined within the VarMeasConfig for this event:

remove the concerned cell(s) in the cellsTriggeredList defined within the VarMeasReportList for this measId;

if reportOnLeave is set to TRUE for the corresponding reporting configuration:

initiate the measurement reporting procedure, as specified in 5.5.5;

if the cellsTriggeredList defined within the VarMeasReportList for this measId is empty:

remove the measurement reporting entry within the VarMeasReportList for this measId;

stop the periodical reporting timer for this measId, if running;

if the purpose is included and set to 'reportStrongestCells' or to 'reportStrongestCellsForSON' and if a (first) measurement result is available for one or more applicable cells:

include a measurement reporting entry within the VarMeasReportList for this measId;

set the numberOfReportsSent defined within the VarMeasReportList for this measId to 0;

initiate the measurement reporting procedure, as specified in 5.5.5;
NOTE 1: If the purpose is set to 'reportStrongestCells', the UE initiates a first measurement report immediately after the quantity to be reported becomes available for at least either serving cell or one of the applicable cells. If the purpose is set to 'reportStrongestCellsForSON', the UE initiates a first measurement report when it has determined the strongest cells on the associated frequency.

2> upon expiry of the periodical reporting timer for this measId:
3> initiate the measurement reporting procedure, as specified in 5.5.5;

2> if the purpose is included and set to 'reportCGI' and if the UE acquired the information needed to set all fields of cgi-Info for the requested cell:
3> include a measurement reporting entry within the VarMeasReportList for this measId;
3> set the numberOfReportsSent defined within the VarMeasReportList for this measId to 0;
3> stop timer T321;
3> initiate the measurement reporting procedure, as specified in 5.5.5;

2> upon expiry of the T321 for this measId:
3> include a measurement reporting entry within the VarMeasReportList for this measId;
3> set the numberOfReportsSent defined within the VarMeasReportList for this measId to 0;
3> initiate the measurement reporting procedure, as specified in 5.5.5;

NOTE 2: The UE does not stop the periodical reporting with triggerType set to 'event' or to 'periodical' while the corresponding measurement is not performed due to the serving cell RSRP being equal to or better than s-Measure or due to the measurement gap not being setup.

NOTE 3: If the UE is configured with DRX, the UE may delay the measurement reporting for event triggered and periodical triggered measurements until the Active Time, which is defined in TS 36.321 [6].

5.5.4.2 Event A1 (Serving becomes better than threshold)

The UE shall:

1> consider the entering condition for this event to be satisfied when condition A1-1, as specified below, is fulfilled;
1> consider the leaving condition for this event to be satisfied when condition A1-2, as specified below, is fulfilled;

Inequality A1-1 (Entering condition)

\[ M_s - H_{ys} > T_{hresh} \]

Inequality A1-2 (Leaving condition)

\[ M_s + H_{ys} < T_{hresh} \]

The variables in the formula are defined as follows:

- \( M_s \) is the measurement result of the serving cell, not taking into account any offsets.
- \( H_{ys} \) is the hysteresis parameter for this event (i.e. hysteresis as defined within reportConfigEUTRA for this event).
- \( T_{hresh} \) is the threshold parameter for this event (i.e. a1-Threshold as defined within reportConfigEUTRA for this event).

\( M_s \) is expressed in dBm in case of RSRP, or in dB in case of RSRQ.

\( H_{ys} \) is expressed in dB.

\( T_{hresh} \) is expressed in the same unit as \( M_s \).
5.5.4.3 Event A2 (Serving becomes worse than threshold)

The UE shall:

1> consider the entering condition for this event to be satisfied when condition A2-1, as specified below, is fulfilled;
1> consider the leaving condition for this event to be satisfied when condition A2-2, as specified below, is fulfilled;

Inequality A2-1 (Entering condition)

\[ Ms + Hys < \text{Threshold} \]

Inequality A2-2 (Leaving condition)

\[ Ms - Hys > \text{Threshold} \]

The variables in the formula are defined as follows:

- \( Ms \) is the measurement result of the serving cell, not taking into account any offsets.
- \( Hys \) is the hysteresis parameter for this event (i.e. \( hysteresis \) as defined within \( \text{reportConfigEUTRA} \) for this event).
- \( \text{Threshold} \) is the threshold parameter for this event (i.e. \( a2\text{-Threshold} \) as defined within \( \text{reportConfigEUTRA} \) for this event).
- \( Ms \) is expressed in dBm in case of RSRP, or in dB in case of RSRQ.
- \( Hys \) is expressed in dB.
- \( \text{Threshold} \) is expressed in the same unit as \( Ms \).

5.5.4.4 Event A3 (Neighbour becomes offset better than serving)

The UE shall:

1> consider the entering condition for this event to be satisfied when condition A3-1, as specified below, is fulfilled;
1> consider the leaving condition for this event to be satisfied when condition A3-2, as specified below, is fulfilled;

Inequality A3-1 (Entering condition)

\[ Mn + Ofn + Ocn - Hys > Ms + Ofs + Ocs + Off \]

Inequality A3-2 (Leaving condition)

\[ Mn + Ofn + Ocn + Hys < Ms + Ofs + Ocs + Off \]

The variables in the formula are defined as follows:

- \( Mn \) is the measurement result of the neighbouring cell, not taking into account any offsets.
- \( Ofn \) is the frequency specific offset of the frequency of the neighbour cell (i.e. \( offsetFreq \) as defined within \( \text{measObjectEUTRA} \) corresponding to the frequency of the neighbour cell).
- \( Ocn \) is the cell specific offset of the neighbour cell (i.e. \( cellIndividualOffset \) as defined within \( \text{measObjectEUTRA} \) corresponding to the frequency of the neighbour cell), and set to zero if not configured for the neighbour cell.
- \( Ms \) is the measurement result of the serving cell, not taking into account any offsets.
- \( Ofs \) is the frequency specific offset of the serving frequency (i.e. \( offsetFreq \) as defined within \( \text{measObjectEUTRA} \) corresponding to the serving frequency).
- \( Ocs \) is the cell specific offset of the serving cell (i.e. \( cellIndividualOffset \) as defined within \( \text{measObjectEUTRA} \) corresponding to the serving frequency), and is set to zero if not configured for the serving cell.
- \( Hys \) is the hysteresis parameter for this event (i.e. \( hysteresis \) as defined within \( \text{reportConfigEUTRA} \) for this event).
**5.5.4.5 Event A4 (Neighbour becomes better than threshold)**

The UE shall:

1. consider the entering condition for this event to be satisfied when condition A4-1, as specified below, is fulfilled;
2. consider the leaving condition for this event to be satisfied when condition A4-2, as specified below, is fulfilled;

\[
\text{Inequality A4-1 (Entering condition)}
\]
\[
M_n + O_{fn} + O_{cn} - H_y - O_{fs} > Th_{resh}
\]

\[
\text{Inequality A4-2 (Leaving condition)}
\]
\[
M_n + O_{fn} + O_{cn} + H_y < Th_{resh}
\]

The variables in the formula are defined as follows:

- **\( M_n \)** is the measurement result of the neighbouring cell, not taking into account any offsets.
- **\( O_{fn} \)** is the frequency specific offset of the frequency of the neighbour cell (i.e. \( \text{offsetFreq} \) as defined within \( \text{measObjectEUTRA} \) corresponding to the frequency of the neighbour cell).
- **\( O_{cn} \)** is the cell specific offset of the neighbour cell (i.e. \( \text{cellIndividualOffset} \) as defined within \( \text{measObjectEUTRA} \) corresponding to the frequency of the neighbour cell), and set to zero if not configured for the neighbour cell.
- **\( H_y \)** is the hysteresis parameter for this event (i.e. \( \text{hysteresis} \) as defined within \( \text{reportConfigEUTRA} \) for this event).
- **\( Th_{resh} \)** is the threshold parameter for this event (i.e. \( a4-\text{Threshold} \) as defined within \( \text{reportConfigEUTRA} \) for this event).

- **\( M_n \)** is expressed in dBm in case of RSRP, or in dB in case of RSRQ.
- **\( O_{fn}, O_{cn}, H_y \)** are expressed in dB.
- **\( Th_{resh} \)** is expressed in the same unit as **\( M_s \)**.

**5.5.4.6 Event A5 (Serving becomes worse than threshold1 and neighbour becomes better than threshold2)**

The UE shall:

1. consider the entering condition for this event to be satisfied when both conditions A5-1 and condition A5-2, as specified below, are fulfilled;
2. consider the leaving condition for this event to be satisfied when condition A5-3 or condition A5-4, i.e. at least one of the two, as specified below, is fulfilled;

\[
\text{Inequality A5-1 (Entering condition 1)}
\]
\[
M_s + H_y < Th_{resh}
\]

\[
\text{Inequality A5-2 (Entering condition 2)}
\]
\[
M_n + O_{fn} + O_{cn} - H_y > Th_{resh2}
\]

\[
\text{Inequality A5-3 (Leaving condition 1)}
\]
\[
M_s - H_y > Th_{resh}
\]
Inequality A5-4 (Leaving condition 2)
\[ Mn + Ofn + Ocn + Hys < \text{Thresh2} \]

The variables in the formula are defined as follows:
- \text{Ms} is the measurement result of the serving cell, not taking into account any offsets.
- \text{Mn} is the measurement result of the neighbouring cell, not taking into account any offsets.
- \text{Ofn} is the frequency specific offset of the frequency of the neighbour cell (i.e. \text{offsetFreq} as defined within \text{measObjectEUTRA} corresponding to the frequency of the neighbour cell).
- \text{Ocn} is the cell specific offset of the neighbour cell (i.e. \text{cellIndividualOffset} as defined within \text{measObjectEUTRA} corresponding to the frequency of the neighbour cell), and set to zero if not configured for the neighbour cell.
- \text{Hys} is the hysteresis parameter for this event (i.e. \text{hysteresis} as defined within \text{reportConfigEUTRA} for this event).
- \text{Thresh1} is the threshold parameter for this event (i.e. \text{a5-Threshold1} as defined within \text{reportConfigEUTRA} for this event).
- \text{Thresh2} is the threshold parameter for this event (i.e. \text{a5-Threshold2} as defined within \text{reportConfigEUTRA} for this event).

\text{Mn}, \text{Ms} are expressed in dBm in case of RSRP, or in dB in case of RSRQ.

\text{Ofn}, \text{Ocn}, \text{Hys} are expressed in dB.

\text{Thresh1} is expressed in the same unit as \text{Ms}.

\text{Thresh2} is expressed in the same unit as \text{Mn}.

5.5.4.7 Event B1 (Inter RAT neighbour becomes better than threshold)

The UE shall:
1> for UTRA and CDMA2000, only trigger the event for cells included in the corresponding measurement object;
1> consider the entering condition for this event to be satisfied when condition B1-1, as specified below, is fulfilled;
1> consider the leaving condition for this event to be satisfied when condition B1-2, as specified below, is fulfilled;

Inequality B1-1 (Entering condition)
\[ Mn + Ofn - Hys > \text{Thresh} \]

Inequality B1-2 (Leaving condition)
\[ Mn + Ofn + Hys < \text{Thresh} \]

The variables in the formula are defined as follows:
- \text{Mn} is the measurement result of the inter-RAT neighbour cell, not taking into account any offsets. For CDMA 2000 measurement result, \text{pilotStrength} is divided by -2.
- \text{Ofn} is the frequency specific offset of the frequency of the inter-RAT neighbour cell (i.e. \text{offsetFreq} as defined within the \text{measObject} corresponding to the frequency of the neighbour inter-RAT cell).
- \text{Hys} is the hysteresis parameter for this event (i.e. \text{hysteresis} as defined within \text{reportConfigInterRAT} for this event).
- \text{Thresh} is the threshold parameter for this event (i.e. \text{b1-Threshold} as defined within \text{reportConfigInterRAT} for this event). For CDMA2000, \text{b1-Threshold} is divided by -2.
- \text{Mn} is expressed in dBm or in dB, depending on the measurement quantity of the inter-RAT neighbour cell.
- \text{Ofn}, \text{Hys} are expressed in dB.
Threshold is expressed in the same unit as \( M_n \).

### 5.5.4.8 Event B2 (Serving becomes worse than threshold1 and inter RAT neighbour becomes better than threshold2)

The UE shall:

1. for UTRA and CDMA2000, only trigger the event for cells included in the corresponding measurement object;
2. consider the entering condition for this event to be satisfied when both condition B2-1 and condition B2-2, as specified below, are fulfilled;
3. consider the leaving condition for this event to be satisfied when condition B2-3 or condition B2-4, i.e. at least one of the two, as specified below, is fulfilled;

**Inequality B2-1 (Entering condition 1)**

\[ M_s + Hys < \text{Threshold1} \]

**Inequality B2-2 (Entering condition 2)**

\[ M_n + Ofn - Hys > \text{Threshold2} \]

**Inequality B2-3 (Leaving condition 1)**

\[ M_s - Hys > \text{Threshold1} \]

**Inequality B2-4 (Leaving condition 2)**

\[ M_n + Ofn + Hys < \text{Threshold2} \]

The variables in the formula are defined as follows:

- \( M_s \) is the measurement result of the serving cell, not taking into account any offsets.
- \( M_n \) is the measurement result of the inter-RAT neighbour cell, not taking into account any offsets. For CDMA2000 measurement result, \( \text{pilotStrength} \) is divided by \( -2 \).
- \( Ofn \) is the frequency specific offset of the frequency of the inter-RAT neighbour cell (i.e. \( \text{offsetFreq} \) as defined within the \( \text{measObject} \) corresponding to the frequency of the inter-RAT neighbour cell).
- \( Hys \) is the hysteresis parameter for this event (i.e. \( \text{hysteresis} \) as defined within \( \text{reportConfigInterRAT} \) for this event).
- \( \text{Threshold1} \) is the threshold parameter for this event (i.e. \( b2-\text{Threshold1} \) as defined within \( \text{reportConfigInterRAT} \) for this event).
- \( \text{Threshold2} \) is the threshold parameter for this event (i.e. \( b2-\text{Threshold2} \) as defined within \( \text{reportConfigInterRAT} \) for this event). For CDMA2000, \( b2-\text{Threshold2} \) is divided by \(-2\).

\( M_s \) is expressed in dBm in case of RSRP, or in dB in case of RSRQ.

\( M_n \) is expressed in dBm or dB, depending on the measurement quantity of the inter-RAT neighbour cell.

\( Ofn, Hys \) are expressed in dB.

\( \text{Threshold1} \) is expressed in the same unit as \( M_s \).

\( \text{Threshold2} \) is expressed in the same unit as \( M_n \).
5.5.5 Measurement reporting

![Diagram](image)

**Figure 5.5.5-1: Measurement reporting**

The purpose of this procedure is to transfer measurement results from the UE to E-UTRAN.

For the `measId` for which the measurement reporting procedure was triggered, the UE shall set the `measResults` within the `MeasurementReport` message as follows:

1. set the `measId` to the measurement identity that triggered the measurement reporting;
2. set the `measResultServCell` to include the quantities of serving cell;
3. if there is at least one applicable neighbouring cell to report:
   1. set the `measResultNeighCells` to include the best neighbouring cells up to `maxReportCells` in accordance with the following:
      1. if the `triggerType` is set to 'event':
         1. include the cells included in the `cellsTriggeredList` as defined within the `VarMeasReportList` for this `measId`;
      2. else:
         1. include the applicable cells for which the new measurement results became available since the last periodical reporting or since the measurement was initiated or reset;

**NOTE:** The reliability of the report (i.e. the certainty it contains the strongest cells on the concerned frequency) depends on the measurement configuration i.e. the `reportInterval`. The related performance requirements are specified in TS 36.133 [16].

3. for each cell that is included in the `measResultNeighCells`, include the `physCellId`;
4. if the `triggerType` is set to 'event', or the `purpose` is set to 'reportStrongestCells' or to 'reportStrongestCellsForSON':
   1. for each included cell, include the layer 3 filtered measured results in accordance with the `reportConfig` for this `measId`, ordered as follows:
      1. if the `measObject` associated with this `measId` concerns E-UTRA:
         1. set the `measResult` to include the quantity(ies) indicated in the `reportQuantity` within the concerned `reportConfig` in order of decreasing `triggerQuantity`, i.e. the best cell is included first;
      2. else:
         1. set the `measResult` to the quantity as configured for the concerned RAT within the `quantityConfig` in order of either decreasing quantity for UTRA and GERAN or increasing quantity for CDMA2000 `pilotStrength`, i.e. the best cell is included first;
4. else if the `purpose` is set to 'reportCGI':
   1. if the mandatory present fields of the `cgi-Info` for the cell indicated by the `cellForWhichToReportCGI` in the associated `measObject` have been obtained:
5> if the cell broadcasts a CSG identity:
   6> include the csg-Identity;
   6> include the csg-MemberStatus and set it to 'member' if the CSG identity is included in the UE’s CSG whitelist;
5> if the 'si-RequestForHO' is configured within the reportConfig associated with this measId:
   6> include the cgi-Info containing all the fields that have been successfully acquired, except for the plmn-IdentityList;
5> else:
   6> include the cgi-Info containing all the fields that have been successfully acquired;
1> if the ue-RxTxTimeDiffPeriodical is configured within the corresponding reportConfig for this measId:
   2> set the ue-RxTxTimeDiffResult to the measurement result provided by lower layers;
   2> set the currentSFN;
1> increment the numberOfReportsSent as defined within the VarMeasReportList for this measId by 1;
1> stop the periodical reporting timer, if running;
1> if the numberOfReportsSent as defined within the VarMeasReportList for this measId is less than the reportAmount as defined within the corresponding reportConfig for this measId:
   2> start the periodical reporting timer with the value of reportInterval as defined within the corresponding reportConfig for this measId;
1> else:
   2> if the triggerType is set to 'periodical':
      3> remove the entry within the VarMeasReportList for this measId;
      3> remove this measId from the measIdList within VarMeasConfig;
1> if the measured results are for CDMA2000 HRPD:
   2> set the preRegistrationStatusHRPD to the UE’s CDMA2000 upper layer’s HRPD preRegistrationStatus;
1> if the measured results are for CDMA2000 1xRTT:
   2> set the preRegistrationStatusHRPD to 'FALSE';
1> submit the MeasurementReport message to lower layers for transmission, upon which the procedure ends;

5.5.6 Measurement related actions

5.5.6.1 Actions upon handover and re-establishment

E-UTRAN applies the handover procedure as follows:
- when performing the handover procedure, as specified in 5.3.5.4, ensure that a measObjectId corresponding to the handover target carrier frequency is configured as a result of the procedures described in this sub-clause and in 5.3.5.4;

E-UTRAN applies the re-establishment procedure as follows:
- when performing the connection re-establishment procedure, as specified in 5.3.7, ensure that a measObjectId corresponding to the target carrier frequency is configured as a result of the procedure described in this sub-clause and the subsequent connection reconfiguration procedure immediately following the re-establishment procedure;
The UE shall:

1. for each `measId` included in the `measIdList` within `VarMeasConfig`:
   2. if the `triggerType` is set to 'periodical':
      3. remove this `measId` from the `measIdList` within `VarMeasConfig`:
   1. if the procedure was triggered due to inter-frequency handover or successful re-establishment to an inter-frequency cell, update the `measId` values in the `measIdList` within `VarMeasConfig` as follows:
      2. if a `measObjectId` value corresponding to the target carrier frequency exists in the `measObjectList` within `VarMeasConfig`:
         3. for each `measId` value in the `measIdList`:
            4. if the `measId` value is linked to the `measObjectId` value corresponding to the source carrier frequency:
               5. link this `measId` value to the `measObjectId` value corresponding to the target carrier frequency;
            4. else if the `measId` value is linked to the `measObjectId` value corresponding to the target carrier frequency:
               5. link this `measId` value to the `measObjectId` value corresponding to the source carrier frequency;
      2. else:
         3. remove all `measId` values that are linked to the `measObjectId` value corresponding to the source carrier frequency;
   1. remove all measurement reporting entries within `VarMeasReportList`;
   1. stop the periodical reporting timer or timer T321, whichever one is running, as well as associated information (e.g. `timeToTrigger`) for all `measId`;
   1. release the measurement gaps, if activated;

NOTE: If the UE requires measurement gaps to perform inter-frequency or inter-RAT measurements, the UE resumes the inter-frequency and inter-RAT measurements after the E-UTRAN has setup the measurement gaps.

5.5.6.2  Speed dependant scaling of measurement related parameters

The UE shall adjust the value of the following parameter configured by the E-UTRAN depending on the UE speed: `timeToTrigger`. The UE shall apply 3 different levels, which are selected as follows:

The UE shall:

1. perform mobility state detection using the mobility state detection as specified in TS 36.304 [4] with the following modifications:
   2. counting handovers instead of cell reselections;
   2. applying the parameter applicable for RRC_CONNECTED as included in `speedStatePars` within `VarMeasConfig`;
1. if high mobility state is detected:
   2. use the `timeToTrigger` value multiplied by `sf-High` within `VarMeasConfig`;
1. else if medium mobility state is detected:
   2. use the `timeToTrigger` value multiplied by `sf-Medium` within `VarMeasConfig`;
1. else
   2. no scaling is applied;
5.6 Other

5.6.1 DL information transfer

5.6.1.1 General

```
UE -> EUTRAN
DLInformationTransfer
```

Figure 5.6.1.1-1: DL information transfer

The purpose of this procedure is to transfer NAS or (tunnelled) non-3GPP dedicated information from E-UTRAN to a UE in RRC_CONNECTED.

5.6.1.2 Initiation

E-UTRAN initiates the DL information transfer procedure whenever there is a need to transfer NAS or non-3GPP dedicated information. E-UTRAN initiates the DL information transfer procedure by sending the DLInformationTransfer message.

5.6.1.3 Reception of the DLInformationTransfer by the UE

Upon receiving DLInformationTransfer message, the UE shall:

1> if the dedicatedInfoType is set to 'dedicatedInfoNAS':
   2> forward the dedicatedInfoNAS to the NAS upper layers.

1> if the dedicatedInfoType is set to 'dedicatedInfoCDMA2000-1XRTT' or to 'dedicatedInfoCDMA2000-HRPD':
   2> forward the dedicatedInfoCDMA2000 to the CDMA2000 upper layers;

5.6.2 UL information transfer

5.6.2.1 General

```
UE <- EUTRAN
ULInformationTransfer
```

Figure 5.6.2.1-1: UL information transfer

The purpose of this procedure is to transfer NAS or (tunnelled) non-3GPP dedicated information from the UE to E-UTRAN.

5.6.2.2 Initiation

A UE in RRC_CONNECTED initiates the UL information transfer procedure whenever there is a need to transfer NAS or non-3GPP dedicated information, except at RRC connection establishment in which case the NAS information is
piggybacked to the **RRCC**onnectionSet**upComplete** message. The UE initiates the UL information transfer procedure by sending the **UL**nformation**T**ransfer message. When CDMA2000 information has to be transferred, the UE shall initiate the procedure only if SRB2 is established.

### 5.6.2.3 Actions related to transmission of **UL**nformation**T**ransfer message

The UE shall set the contents of the **UL**nformation**T**ransfer message as follows:

1. if there is a need to transfer NAS information:
   2. set the `dedicatedInfoType` to include the `dedicatedInfoNAS`;
2. if there is a need to transfer CDMA2000 1XRTT information:
   2. set the `dedicatedInfoType` to include the `dedicatedInfoCDMA2000-1XRTT`;
3. if there is a need to transfer CDMA2000 HRPD information:
   2. set the `dedicatedInfoType` to include the `dedicatedInfoCDMA2000-HRPD`;
1. submit the **UL**nformation**T**ransfer message to lower layers for transmission, upon which the procedure ends;

### 5.6.2.4 Failure to deliver **UL**nformation**T**ransfer message

The UE shall:

1. if mobility (i.e. handover, RRC connection re-establishment) occurs before the successful delivery of **UL**nformation**T**ransfer messages has been confirmed by lower layers:
   2. inform upper layers about the possible failure to deliver the information contained in the concerned **UL**nformation**T**ransfer messages;

### 5.6.3 UE capability transfer

#### 5.6.3.1 General

![Figure 5.6.3.1-1: UE capability transfer](image)

The purpose of this procedure is to transfer UE radio access capability information from the UE to E-UTRAN.

If the UE has changed its E-UTRAN radio access capabilities, the UE shall request higher layers to initiate the necessary NAS procedures (see TS 23.401 [41]) that would result in the update of UE radio access capabilities using a new RRC connection.

**NOTE:** Change of the UE’s GERAN UE radio capabilities in RRC_IDLE is supported by use of Tracking Area Update.
5.6.3.2 Initiation

E-UTRAN initiates the procedure to a UE in RRC_CONNECTED when it needs (additional) UE radio access capability information.

5.6.3.3 Reception of the **UECapabilityEnquiry** by the UE

The UE shall:

1> set the contents of **UECapabilityInformation** message as follows:

2> if the **ue-CapabilityRequest** includes 'utra':

   3> include the UE-EUTRA-Capability within a **ue-CapabilityRAT-Container** and with the **rat-Type** set to 'utra';

2> if the **ue-CapabilityRequest** includes 'geran-cs' and if the UE supports GERAN CS domain:

   3> include the UE radio access capabilities for GERAN CS within a **ue-CapabilityRAT-Container** and with the **rat-Type** set to 'geran-cs';

2> if the **ue-CapabilityRequest** includes 'geran-ps' and if the UE supports GERAN PS domain:

   3> include the UE radio access capabilities for GERAN PS within a **ue-CapabilityRAT-Container** and with the **rat-Type** set to 'geran-ps';

2> if the **ue-CapabilityRequest** includes 'utra' and if the UE supports UTRA:

   3> include the UE radio access capabilities for UTRA within a **ue-CapabilityRAT-Container** and with the **rat-Type** set to 'utra';

2> if the **ue-CapabilityRequest** includes 'cdma2000-1XRTT' and if the UE supports CDMA2000 1xRTT:

   3> include the UE radio access capabilities for CDMA2000 within a **ue-CapabilityRAT-Container** and with the **rat-Type** set to 'cdma2000-1XRTT';

1> submit the **UECapabilityInformation** message to lower layers for transmission, upon which the procedure ends;

5.6.4 CSFB to 1x Parameter transfer

5.6.4.1 General

![Figure 5.6.4.1-1: CSFB to 1x Parameter transfer](image)

The purpose of this procedure is to transfer the CDMA2000 1xRTT parameters required to register the UE in the CDMA2000 1xRTT network for CSFB support.
5.6.4.2 Initiation

A UE in RRC_CONNECTED initiates the CSFB to 1x Parameter transfer procedure upon request from the CDMA2000 upper layers. The UE initiates the CSFB to 1x Parameter transfer procedure by sending the CSFBParametersRequestCDMA2000 message.

5.6.4.3 Actions related to transmission of CSFBParametersRequestCDMA2000 message

The UE shall:

1> submit the CSFBParametersRequestCDMA2000 message to lower layers for transmission using the current configuration;

5.6.4.4 Reception of the CSFBParametersResponseCDMA2000 message

Upon reception of the CSFBParametersResponseCDMA2000 message, the UE shall:

1> forward the rand and the mobilityParameters to the CDMA2000 1xRTT upper layers;

5.6.5 UE Information

5.6.5.1 General

![Diagram]

Figure 5.6.5.1-1: UE information procedure

The UE information procedure is used by E-UTRAN to request the UE to report information.

5.6.5.2 Initiation

E-UTRAN initiates the procedure by sending the UEInformationRequest message.

5.6.5.3 Reception of the UEInformationRequest message

Upon receiving the UEInformationRequest message, the UE shall:

1> if rach-ReportReq is set to true, set the contents of the rach-Report in the UEInformationResponse message as follows:

2> set the numberOfPreamblesSent to indicate the number of preambles sent by MAC for the last successfully completed random access procedure

2> if contention is detected by MAC for at least one of the transmitted preambles for the last successfully completed random access procedure:

3> set the contentionDetected to true;

2> else:

3> set the contentionDetected to false;
if rlf-ReportReq is set to true and there is radio link failure information available, set the contents of the rlf-Report in the UEInformationResponse message as follows:

1> set the measResultLastServCell;

2> set the measResultNeighCells in order of decreasing triggerQuantity to include the best neighbouring cells based on measurements collected up to the moment the UE detected radio link failure;

3> if the UE was configured to perform measurements for one or more neighbouring EUTRA frequencies, include the measResultListEUTRA and include the corresponding carrierFreq and measResultList;

3> if the UE was configured to perform measurement reporting for one or more neighbouring UTRA frequencies, include the measResultListUTRA and include the corresponding carrierFreq and measResultList;

3> if the UE was configured to perform measurement reporting for one or more neighbouring GERAN frequencies, include the measResultListGERAN;

3> if the UE was configured to perform measurement reporting for one or more neighbouring CDMA2000 frequencies, include the measResultsCDMA2000 and include the corresponding carrierFreq and measResultList;

NOTE The measured quantities are filtered by L3 filter as configured in mobility measurement configuration. Blacklisted cells are not required to be reported.

1> submit the UEInformationResponse message to lower layers for transmission upon which the procedure ends;

### 5.7 Generic error handling

#### 5.7.1 General

The generic error handling defined in the subsequent sub-clauses applies unless explicitly specified otherwise e.g. within the procedure specific error handling.

The UE shall consider a value as not comprehended when it is set:

- to an extended value that is not defined in the version of the transfer syntax supported by the UE.
- to a spare or reserved value unless the specification defines specific behaviour that the UE shall apply upon receiving the concerned spare/ reserved value.

The UE shall consider a field as not comprehended when it is defined:

- as spare or reserved unless the specification defines specific behaviour that the UE shall apply upon receiving the concerned spare/ reserved field.

#### 5.7.2 ASN.1 violation or encoding error

The UE shall:

1> when receiving an RRC message on the BCCH, PCCH, CCCH, or MCCH for which the abstract syntax is invalid [13]:

2> ignore the message;

NOTE This section applies in case one or more fields is set to a value, other than a spare, reserved or extended value, not defined in this version of the transfer syntax. E.g. in the case the UE receives value 12 for a field defined as INTEGER (1..11). In cases like this, it may not be possible to reliably detect which field is in the error hence the error handling is at the message level.
5.7.3 Field set to a not comprehended value

The UE shall, when receiving an RRC message on any logical channel:

1> if the message includes a field that has a value that the UE does not comprehend:
   2> if a default value is defined for this field:
      3> treat the message while using the default value defined for this field;
   2> else if the concerned field is optional:
      3> treat the message as if the field were absent and in accordance with the need code for absence of the concerned field;
   2> else:
      3> treat the message as if the field were absent and in accordance with sub-clause 5.7.4;

5.7.4 Mandatory field missing

The UE shall:

1> if the message includes a field that is mandatory to include in the message (e.g. because conditions for mandatory presence are fulfilled) and that field is absent or treated as absent:
   2> if the RRC message was received on DCCH or CCCH:
      3> ignore the message;
   2> else:
      3> if the field concerns a (sub-field of) an entry of a list (i.e. a SEQUENCE OF):
         4> treat the list as if the entry including the missing or not comprehended field was not present;
      3> else if the field concerns a sub-field of another field, referred to as the 'parent' field i.e. the field that is one nesting level up compared to the erroneous field:
         4> consider the 'parent' field to be set to a not comprehended value;
         4> apply the generic error handling to the subsequent 'parent' field(s), until reaching the top nesting level i.e. the message level;
      3> else (field at message level):
         4> ignore the message;

NOTE: The error handling defined in these sub-clauses implies that the UE ignores a message with the message type or version set to a not comprehended value.

5.7.5 Not comprehended field

The UE shall, when receiving an RRC message on any logical channel:

1> if the message includes a field that the UE does not comprehend:
   2> treat the rest of the message as if the field was absent;

NOTE: This section does not apply to the case of an extension to the value range of a field. Such cases are addressed instead by the requirements in section 5.7.3.
5.8 MBMS

5.8.1 Introduction

5.8.1.1 General

In general the control information relevant only for UEs supporting MBMS is separated as much as possible from unicast control information. Most of the MBMS control information is provided on a logical channel specific for MBMS common control information: the MCCH. E-UTRA employs one MCCH logical channel per MBSFN area. In case the network configures multiple MBSFN areas, the UE acquires the MBMS control information from the MCCHs that are configured to identify if services it is interested to receive are ongoing. The action applicable when the UE is unable to simultaneously receive MBMS and unicast services is up to UE implementation. In this release of the specification, an MBMS capable UE is only required to support reception of a single MBMS service at a time, and reception of more than one MBMS service (also possibly on more than one MBSFN area) in parallel is left for UE implementation. The MCCH carries a single message, the MBSFNAreaConfiguration message, which indicates the MBMS sessions that are ongoing as well as the (corresponding) radio resource configuration.

A limited amount of MBMS control information is provided on the BCCH. This primarily concerns the information needed to acquire the MCCH(s). This information is carried by means of a single MBMS specific SystemInformationBlock: SystemInformationBlockType13. An MBSFN area is identified solely by the mbsfn-AreaId in SystemInformationBlockType13. At mobility, the UE considers that the MBSFN area is continuous when the source cell and the target cell broadcast the same value in the mbsfn-AreaId.

5.8.1.2 Scheduling

The MCCH information is transmitted periodically, using a configurable repetition period. Scheduling information is not provided for MCCH i.e. both the time domain scheduling as well as the lower layer configuration are semi-statically configured, as defined within SystemInformationBlockType13.

For MBMS user data, which is carried by the MTCH logical channel, E-UTRAN periodically provides MCH scheduling information (MSI) at lower layers (MAC). This MCH information only concerns the time domain scheduling i.e. the frequency domain scheduling and the lower layer configuration are semi-statically configured. The periodicity of the MSI is configurable and defined by the MCH scheduling period.

5.8.1.3 MCCH information validity and notification of changes

Change of MCCH information only occurs at specific radio frames, i.e. the concept of a modification period is used. Within a modification period, the same MCCH information may be transmitted a number of times, as defined by its scheduling (which is based on a repetition period). The modification period boundaries are defined by SFN values for which SFN mod m = 0, where m is the number of radio frames comprising the modification period. The modification period is configured by means of SystemInformationBlockType13.

When the network changes (some of) the MCCH information, it notifies the UEs about the change during a first modification period. In the next modification period, the network transmits the updated MCCH information. These general principles are illustrated in figure 5.8.1.3-1, in which different colours indicate different MCCH information. Upon receiving a change notification, a UE interested to receive MBMS services acquires the new MCCH information immediately from the start of the next modification period. The UE applies the previously acquired MCCH information until the UE acquires the new MCCH information.

![Figure 5.8.1.3-1: Change of MCCH Information](image-url)
Indication of an MBMS specific RNTI, the M-RNTI (see TS 36.321 [6]), on PDCCH is used to inform UEs in RRC_IDLE and UEs in RRC_CONNECTED about an MCCH information change. When receiving an MCCH information change notification, the UE knows that the MCCH information will change at the next modification period boundary. The notification on PDCCH indicates which of the MCCHs will change, which is done by means of an 8-bit bitmap. Within this bitmap, the bit at the position indicated by the field notificationIndicator is used to indicate changes for that MBSFN area: if the bit is set to "1", the corresponding MCCH will change. No further details are provided e.g. regarding which MCCH information will change. The MCCH information change notification is used only to inform the UE about a change of MCCH information upon session start.

The MCCH information change notifications on PDCCH are transmitted periodically and are carried on MBSFN subframes only. These MCCH information change notification occasions are common for all MCCHs that are configured, and configurable by parameters included in SystemInformationBlockType13: a repetition coefficient, a radio frame offset and a subframe index. These common notification occasions are based on the MCCH with the shortest modification period.

NOTE 1: E-UTRAN may modify the MBMS configuration information provided on MCCH at the same time as updating the MBMS configuration information carried on BCCH i.e. at a coinciding BCCH and MCCH modification period. Upon detecting that a new MCCH is configured on BCCH, a UE interested to receive one or more MBMS services should acquire the MCCH, unless it knows that the services it is interested in are not provided by the corresponding MBSFN area.

A UE that is receiving an MBMS service shall acquire the MCCH information from the start of each modification period. A UE that is not receiving an MBMS service, as well as UEs that are receiving an MBMS service but potentially interested to receive other services not started yet in another MBSFN area, shall verify that the stored MCCH information remains valid by attempting to find the MCCH information change notification at least notificationRepetitionCoeff times during the modification period of the applicable MCCH(s), if no MCCH information change notification is received.

NOTE 2: In case the UE is aware which MCCH(s) E-UTRAN uses for the service(s) it is interested to receive, the UE may only need to monitor change notifications for a subset of the MCCHs that are configured, referred to as the 'applicable MCCH(s)' in the above.

5.8.2 MCCH information acquisition

5.8.2.1 General

![Figure 5.8.2.1-1: MCCH information acquisition](image)

The UE applies the MCCH information acquisition procedure to acquire the MBMS control information that is broadcasted by the E-UTRAN. The procedure applies to MBMS capable UEs that are in RRC_IDLE or in RRC_CONNECTED.

5.8.2.2 Initiation

A UE interested to receive MBMS services shall apply the MCCH information acquisition procedure upon entering the corresponding MBSFN area (e.g. upon power on, following UE mobility) and upon receiving a notification that the MCCH information has changed. A UE that is receiving an MBMS service shall apply the MCCH information acquisition procedure to acquire the MCCH, that corresponds with the service that is being received, at the start of each modification period.

Unless explicitly stated otherwise in the procedural specification, the MCCH information acquisition procedure overwrites any stored MCCH information, i.e. delta configuration is not applicable for MCCH information and the UE discontinues using a field if it is absent in MCCH information unless explicitly specified otherwise.
5.8.2.3 MCCH information acquisition by the UE

An MBMS capable UE shall:

1> if the procedure is triggered by a MCCH information change notification:
   2> start acquiring the MBSFNAreaConfiguration message from the beginning of the modification period following the one in which the change notification was received;

NOTE 1: The UE continues using the previously received MCCH information until the new MCCH information has been acquired.

1> if the UE enters an MBSFN area:
   2> acquire the MBSFNAreaConfiguration message at the next repetition period;

1> if the UE is receiving an MBMS service:
   2> start acquiring the MBSFNAreaConfiguration message, that corresponds with the service that is being received, from the beginning of each modification period;

5.8.2.4 Actions upon reception of the MBSFNAreaConfiguration message

No UE requirements related to the contents of this MBSFNAreaConfiguration apply other than those specified elsewhere e.g. within procedures using the concerned system information, the corresponding field descriptions.

5.8.3 MBMS PTM radio bearer configuration

5.8.3.1 General

The MBMS p-t-m radio bearer configuration procedure is used by the UE to configure RLC, MAC and the physical layer upon starting and or stopping to receive a Point to Multipoint radio bearer. The procedure applies to UEs interested to receive one or more MBMS services.

NOTE: In case the UE is unable to receive an MBMS service due to capability limitations, upper layers may take appropriate action e.g. terminate a lower priority unicast service.

5.8.3.2 Initiation

The UE applies the MBMS PTM radio bearer establishment procedure to start receiving a session of a service it has an interest in. The procedure may be initiated e.g. upon start of the MBMS session, upon (re-)entry of the corresponding MBSFN service area, upon becoming interested in the MBMS service, upon removal of UE capability limitations inhibiting reception of the concerned service.

The UE applies the MBMS PTM radio bearer release procedure to stop receiving a session. The procedure may be initiated e.g. upon stop of the MBMS session, upon leaving the corresponding MBSFN service area, upon losing interest in the MBMS service, when capability limitations start inhibiting reception of the concerned service.

5.8.3.3 PTM RB establishment

Upon PTM RB establishment, the UE shall:

1> establish an RLC entity in accordance with the configuration specified in 9.1.1.4;

1> configure an MTCH logical channel in accordance with the received logicalChannelIdentity, applicable for the PTM RB, as included in the MBSFNAreaConfiguration message;

1> configure the physical layer in accordance with the pmch-Config, applicable for the PTM RB, as included in the MBSFNAreaConfiguration message;

1> inform upper layers about the establishment of the PTM RB by indicating the corresponding tmgi and sessionId;
5.8.3.4 PTM RB release

Upon PTM RB release, the UE shall:

1. release the RLC entity as well as the related MAC and physical layer configuration;
2. inform upper layers about the release of the PTM RB by indicating the corresponding tmgi and sessionId.

6 Protocol data units, formats and parameters (tabular & ASN.1)

6.1 General

The contents of each RRC message is specified in sub-clause 6.2 using ASN.1 to specify the message syntax and using tables when needed to provide further detailed information about the information elements specified in the message syntax. The syntax of the information elements that are defined as stand-alone abstract types is further specified in a similar manner in sub-clause 6.3.

The need for information elements to be present in a message or an abstract type, i.e., the ASN.1 fields that are specified as OPTIONAL in the abstract notation (ASN.1), is specified by means of comment text tags attached to the OPTIONAL statement in the abstract syntax. All comment text tags are available for use in the downlink direction only. The meaning of each tag is specified in table 6.1-1.

Table 6.1-1: Meaning of abbreviations used to specify the need for information elements to be present

<table>
<thead>
<tr>
<th>Abbreviation</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cond conditionTag</td>
<td>An information element for which the need is specified by means of conditions. For each conditionTag, the need is specified in a tabular form following the ASN.1 segment. In case, according to the conditions, a field is not present, the UE takes no action and where applicable shall continue to use the existing value (and/ or the associated functionality) unless explicitly stated otherwise in the description of the field itself.</td>
</tr>
<tr>
<td>Need OP</td>
<td>An information element that is optional to signal. For downlink messages, the UE is not required to take any special action on absence of the IE beyond what is specified in the procedural text or the field description table following the ASN.1 segment. The UE behaviour on absence should be captured either in the procedural text or in the field description.</td>
</tr>
<tr>
<td>Need ON</td>
<td>Optionally present, No action. An information element that is optional to signal. If the message is received by the UE, and in case the information element is absent, the UE shall discontinue/ stop using/ delete any existing value (and/ or the associated functionality).</td>
</tr>
<tr>
<td>Need OR</td>
<td>Optionally present, Release. An information element that is optional to signal. If the message is received by the UE, and in case the information element is absent, the UE shall discontinue/ stop using/ delete any existing value (and/ or the associated functionality).</td>
</tr>
</tbody>
</table>

Any IE with Need ON in system information shall be interpreted as Need OR.

Need codes may not be specified for a group, used in downlink, which includes one or more extensions. Upon absence of such a field, the UE shall:

- For each individual extension, including extensions that are mandatory to include in the optional group, act in accordance with the need code that is defined for the extension;
- Apply this behaviour not only for extensions included directly within the optional field, but also for extensions defined at further nesting levels;

NOTE: The above applies for groups of non critical extensions using double brackets, as well as non-critical extensions at the end of a message or at the end of a structure contained in a BIT STRING or OCTET STRING.
6.2 RRC messages

NOTE: The messages included in this section reflect the current status of the discussions. Additional messages may be included at a later stage.

6.2.1 General message structure

– **EUTRA-RRC-Definitions**

This ASN.1 segment is the start of the E-UTRA RRC PDU definitions.

```asn1
EUTRA-RRC-Definitions DEFINITIONS AUTOMATIC TAGS ::= BEGIN
-- ASN1STOP
```

– **BCCH-BCH-Message**

The *BCCH-BCH-Message* class is the set of RRC messages that may be sent from the E-UTRAN to the UE via BCH on the BCCH logical channel.

```asn1
BCCH-BCH-Message ::= SEQUENCE {
  message        BCCH-BCH-MessageType
}
BCCH-BCH-MessageType ::= MasterInformationBlock
-- ASN1STOP
```

– **BCCH-DL-SCH-Message**

The *BCCH-DL-SCH-Message* class is the set of RRC messages that may be sent from the E-UTRAN to the UE via DL-SCH on the BCCH logical channel.

```asn1
BCCH-DL-SCH-Message ::= SEQUENCE {
  message        BCCH-DL-SCH-MessageType
}
BCCH-DL-SCH-MessageType ::= CHOICE {
  cl CHOICE {
    systemInformation     SystemInformation,
    systemInformationBlockType1 SystemInformationBlockType1
  },
  messageClassExtension  SEQUENCE {}
}
-- ASN1STOP
```

– **MCCH-Message**

The *MCCH-Message* class is the set of RRC messages that may be sent from the E-UTRAN to the UE on the MCCH logical channel.

```asn1
MCCH-Message ::= SEQUENCE {
  message        MCCH-MessageType
}
```
MCCH-MessageType ::= CHOICE {
  cl  CHOICE {
    mbsfnAreaConfiguration-r9  MBSFNAreaConfiguration-r9
  },
  messageClassExtension  SEQUENCE {}
}
-- ASN1STOP

– **PCCH-Message**

The *PCCH-Message* class is the set of RRC messages that may be sent from the E-UTRAN to the UE on the PCCH logical channel.

-- ASN1START

PCCH-Message ::= SEQUENCE {
  message  PCCH-MessageType
}
PCCH-MessageType ::= CHOICE {
  cl  CHOICE {
    paging  Paging
  },
  messageClassExtension  SEQUENCE {}
}
-- ASN1STOP

– **DL-CCCH-Message**

The *DL-CCCH-Message* class is the set of RRC messages that may be sent from the E-UTRAN to the UE on the downlink CCCH logical channel.

-- ASN1START

DL-CCCH-Message ::= SEQUENCE {
  message  DL-CCCH-MessageType
}
DL-CCCH-MessageType ::= CHOICE {
  cl  CHOICE {
    rrcConnectionReestablishment  RRCConnectionReestablishment,
    rrcConnectionReestablishmentReject  RRCConnectionReestablishmentReject,
    rrcConnectionReject  RRCConnectionReject,
    rrcConnectionSetup  RRCConnectionSetup
  },
  messageClassExtension  SEQUENCE {}
}
-- ASN1STOP

– **DL-DCCH-Message**

The *DL-DCCH-Message* class is the set of RRC messages that may be sent from the E-UTRAN to the UE on the downlink DCCH logical channel.

-- ASN1START

DL-DCCH-Message ::= SEQUENCE {
  message  DL-DCCH-MessageType
}
DL-DCCH-MessageType ::= CHOICE {

6.2.2 Message definitions

- CounterCheck

The *CounterCheck* message is used by the E-UTRAN to indicate the current COUNT MSB values associated to each DRB and to request the UE to compare these to its COUNT MSB values and to report the comparison results to E-UTRAN.

**Signalling radio bearer:** SRB1

**RLC-SAP:** AM

**Logical channel:** DCCH

**Direction:** E-UTRAN to UE

**CounterCheck message**

```asn1
CounterCheck ::= SEQUENCE {
  rrc-TransactionIdentifier  RRC-TransactionIdentifier,
  criticalExtensions CHOICE {
    cl CHOICE {
      counterCheck-r8 CounterCheck-r8-IEs,
      spare3 NULL, spare2 NULL, spare1 NULL
    },
    criticalExtensionsFuture SEQUENCE {}
  }
}

CounterCheck-r8-IEs ::= SEQUENCE {
  drb-CountMSB-InfoList DRB-CountMSB-InfoList,
  nonCriticalExtension CounterCheck-v8a0-IEs OPTIONAL
}

CounterCheck-v8a0-IEs ::= SEQUENCE {
  lateR8NonCriticalExtension OCTET STRING OPTIONAL, -- Need OP
  nonCriticalExtension SEQUENCE {} OPTIONAL -- Need OP
}

DRB-CountMSB-InfoList ::= SEQUENCE (SIZE (1..maxDRB)) OF DRB-CountMSB-Info

DRB-CountMSB-Info ::= SEQUENCE {
  drb-Identity DRB-Identity,
  countMSB-Uplink INTEGER(0..33554431),
  countMSB-Downlink INTEGER(0..33554431)
}
```

---

**CounterCheck field descriptions**

- `drb-CountMSB-InfoList` Indicates the MSBs of the COUNT values of the DRBs.
- `count-MSB-Uplink` Indicates the value of 25 MSBs from uplink COUNT associated to this DRB.
- `count-MSB-Downlink` Indicates the value of 25 MSBs from downlink COUNT associated to this DRB.
-- CounterCheckResponse

The CounterCheckResponse message is used by the UE to respond to a CounterCheck message.

Signalling radio bearer: SRB1
RLC-SAP: AM
Logical channel: DCCH
Direction: UE to E-UTRAN

CounterCheckResponse message

-- ASN1START

CounterCheckResponse ::= SEQUENCE {
  rrc-TransactionIdentifier RRC-TransactionIdentifier,
  criticalExtensions CHOICE {
    counterCheckResponse-r8 CounterCheckResponse-r8-IEs,
    criticalExtensionsFuture SEQUENCE {}
  }
}

CounterCheckResponse-r8-IEs ::= SEQUENCE {
  drb-CountInfoList DRB-CountInfoList,

  OPTIONAL
}

DRB-CountInfoList ::= SEQUENCE (SIZE (0..maxDRB)) OF DRB-CountInfo

DRB-CountInfo ::= SEQUENCE{
  drb-Identity DRB-Identity,
  count-Uplink INTEGER(0..4294967295),
  count-Downlink INTEGER(0..4294967295)

-- ASN1STOP

CounterCheckResponse field descriptions

drb-CountInfoList
Indicates the COUNT values of the DRBs.

count-Uplink
Indicates the value of uplink COUNT associated to this DRB.

count-Downlink
Indicates the value of downlink COUNT associated to this DRB.

-- CSFBParametersRequestCDMA2000

The CSFBParametersRequestCDMA2000 message is used by the UE to obtain the CDMA2000 1xRTT Parameters from the network. The UE needs these parameters to generate the CDMA2000 1xRTT Registration message used to register with the CDMA2000 1xRTT Network which is required to support CSFB to CDMA2000 1xRTT.
Signalling radio bearer: SRB1
RLC-SAP: AM
Logical channel: DCCH
Direction: UE to E-UTRAN

**CSFBParametersRequestCDMA2000 message**

```plaintext
-- ASN1START
CSFBParametersRequestCDMA2000 ::= SEQUENCE {
   criticalExtensions  CHOICE {
      csfbParametersRequestCDMA2000-r8  CSFBParametersRequestCDMA2000-r8-IEs,
      criticalExtensionsFuture  SEQUENCE {}
   }
}
CSFBParametersRequestCDMA2000-r8-IEs ::= SEQUENCE {
   nonCriticalExtension  CSFBParametersRequestCDMA2000-v8a0-IEs
   OPTIONAL
}
CSFBParametersRequestCDMA2000-v8a0-IEs ::= SEQUENCE {
   lateR8NonCriticalExtension OCTET STRING
   OPTIONAL,
   nonCriticalExtension  SEQUENCE {}
   OPTIONAL
}
-- ASN1STOP
```

**CSFBParametersResponseCDMA2000**

The **CSFBParametersResponseCDMA2000** message is used to provide the CDMA2000 1xRTT Parameters to the UE so the UE can register with the CDMA2000 1xRTT Network to support CSFB to CDMA2000 1xRTT.

Signalling radio bearer: SRB1
RLC-SAP: AM
Logical channel: DCCH
Direction: E-UTRAN to UE

**CSFBParametersResponseCDMA2000 message**

```plaintext
-- ASN1START
CSFBParametersResponseCDMA2000 ::= SEQUENCE {

**DLInformationTransfer**

The *DLInformationTransfer* message is used for the downlink transfer of dedicated NAS information.

Signalling radio bearer: SRB2 or SRB1 (only if SRB2 not established yet. If SRB2 is suspended, E-UTRAN does not send this message until SRB2 is resumed.)

RLC-SAP: AM

Logical channel: DCCH

Direction: E-UTRAN to UE

**DLInformationTransfer message**

```
DLInformationTransfer ::= SEQUENCE {
    rrc-TransactionIdentifier   RRC-TransactionIdentifier,
    criticalExtensions    CHOICE {
        c1                CHOICE {

```

**HandoverFromEUTRAPreparationRequest (CDMA2000)**

The *HandoverFromEUTRAPreparationRequest* message is used to trigger the handover preparation procedure with a CDMA2000 RAT. This message is also used to trigger a tunneled preparation procedure with a CDMA2000 1xRTT RAT to obtain traffic channel resources for the enhanced CS fallback to CDMA2000 1xRTT, which may also involve a concurrent preparation for handover to CDMA2000 HRPD.

Signalling radio bearer: SRB1

RLC-SAP: AM

Logical channel: DCCH

Direction: E-UTRAN to UE

**HandoverFromEUTRAPreparationRequest message**

```
HandoverFromEUTRAPreparationRequest ::= SEQUENCE {
    rrc-TransactionIdentifier   RRC-TransactionIdentifier,

-- ASN1STOP

HandoverFromEUTRApreparationRequest field descriptions

\textit{concurrPrepCDMA2000-HRPD}

Value TRUE indicates that upper layers should initiate concurrent preparation for handover to CDMA2000 HRPD in addition to preparation for enhanced CS fallback to CDMA2000 1xRTT.

---

Conditional presence | Explanation
--- | ---
cdma2000-Type | The field is mandatory present if the \textit{cdma2000-Type} = type1XRTT; otherwise it is not present.

-- MasterInformationBlock

The \textit{MasterInformationBlock} includes the system information transmitted on BCH.

- Signalling radio bearer: N/A
- RLC-SAP: TM
- Logical channel: BCCH
- Direction: E-UTRAN to UE

\textit{MasterInformationBlock}

-- ASN1START

MasterInformationBlock ::= SEQUENCE {
dl-Bandwidth ENUMERATED {

},
phich-Config PHICH-Config,
systemFrameNumber BIT STRING (SIZE (8)),
spare BIT STRING (SIZE (10))
}

-- ASN1STOP
MasterInformationBlock field descriptions

dl-Bandwidth
Parameter: transmission bandwidth configuration, N\textsubscript{RB} in downlink, see TS 36.101 [42, table 5.6-1]. n6 corresponds to 6 resource blocks, n15 to 15 resource blocks and so on.

systemFrameNumber
Defines the 8 most significant bits of the SFN. As indicated in TS 36.211 [21, 6.6.1], the 2 least significant bits of the SFN are acquired implicitly in the P-BCH decoding, i.e. timing of 40ms P-BCH TTI indicates 2 least significant bits (within 40ms P-BCH TTI, the first radio frame: 00, the second radio frame: 01, the third radio frame: 10, the last radio frame: 11).

– MBSFNAreaConfiguration

The MBSFNAreaConfiguration message contains the MBMS control information applicable for an MBSFN area. E-UTRAN configures an MCCCH for each MBSFN area i.e. the MCCH identifies the MBSFN area.

Signalling radio bearer: N/A
RLC-SAP: UM
Logical channel: MCCH
Direction: E-UTRAN to UE

CommonSF-AllocPatternList-r9 ::= SEQUENCE (SIZE (1..maxMBSFN-Allocations)) OF MBSFN-SubframeConfig
-- ASN1STOP

MBSFNAreaConfiguration field descriptions

commonSF-Alloc
Indicates the subframes allocated to the MBSFN area

commonSF-AllocPeriod
Indicates the period during which resources corresponding with field commonSF-Alloc are divided between the (P)MCH that are configured for this MBSFN area. The subframe allocation patterns, as defined by commonSF-Alloc, repeat continuously during this period. Value rf4 corresponds to 4 radio frames, rf8 corresponds to 8 radio frames and so on.

– MeasurementReport

The MeasurementReport message is used for the indication of measurement results.
Signalling radio bearer: SRB1
RLC-SAP: AM
Logical channel: DCCH
Direction: UE to E-UTRAN

MobilityFromEUTRACommand field descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>t304</td>
<td>Timer T304 as described in section 7.3. Value ms100 corresponds with 100 ms, ms200 corresponds with 200 ms and so on.</td>
</tr>
<tr>
<td>cs-FallbackIndicator</td>
<td>Indicates whether or not the CS Fallback procedure is triggered. E-UTRAN only applies value 'false' when targetRAT-Type is set to 'cdma2000-1XRTT' or to 'cdma2000-HRPD'.</td>
</tr>
<tr>
<td>purpose</td>
<td>Indicates which type of mobility procedure the UE is requested to perform. EUTRAN always applies value e-CSFB in case of enhanced CS fallback to CDMA2000 (e.g. also when that procedure results in handover to CDMA2000 1XRTT only, in handover to CDMA2000 HRPD only or in redirection to CDMA2000 HRPD only).</td>
</tr>
<tr>
<td>targetRAT-Type</td>
<td>Indicates the target RAT type.</td>
</tr>
<tr>
<td>targetRAT-MessageContainer</td>
<td>The field contains a message specified in another standard, as indicated by the targetRAT-Type, and carries information about the target cell identifier(s) and radio parameters relevant for the target radio access technology. NOTE 1. A complete message is included, as specified in the other standard.</td>
</tr>
<tr>
<td>nas-SecurityParamFromEUTRA</td>
<td>Used to deliver the key synchronisation and Key freshness for the E-UTRAN to UTRAN handovers as specified in TS 33.401. The content of the parameter is defined in TS24.301.</td>
</tr>
<tr>
<td>carrierFreq</td>
<td>contains the carrier frequency of the target GERAN cell.</td>
</tr>
<tr>
<td>networkControlOrder</td>
<td>Parameter NETWORK_CONTROL_ORDER in TS 44.060 [36].</td>
</tr>
<tr>
<td>SystemInfoListGERAN</td>
<td>If purpose = 'CellChangeOrder' and if the field is not present, the UE has to acquire SI/PSI from the GERAN cell.</td>
</tr>
<tr>
<td>mobilityCDMA2000-HRPD</td>
<td>This field indicates whether or not mobility to CDMA2000 HRPD is to be performed by the UE and it also indicates the type of mobility to CDMA2000 HRPD that is to be performed; If this field is not present the UE shall perform only the enhanced CS fallback to CDMA2000 1xRTT.</td>
</tr>
<tr>
<td>messageContCDMA2000-1XRTT</td>
<td>This field contains a message specified in CDMA2000 1xRTT standard that either tells the UE to move to specific 1xRTT target cell(s) or indicates a failure to allocate resources for the enhanced CS fallback to CDMA2000 1xRTT.</td>
</tr>
<tr>
<td>messageContCDMA2000-HRPD</td>
<td>This field contains a message specified in CDMA2000 HRPD standard that either tells the UE to move to specific HRPD target cell(s) or indicates a failure to allocate resources for the handover to CDMA2000 HRPD.</td>
</tr>
<tr>
<td>redirectCarrierCDMA2000-HRPD</td>
<td>The redirectCarrierCDMA2000-HRPD indicates a CDMA2000 carrier frequency and is used to redirect the UE to a HRPD carrier frequency.</td>
</tr>
</tbody>
</table>

NOTE 1: The correspondence between the value of the targetRAT-Type, the standard to apply and the message contained within the targetRAT-MessageContainer is shown in the table below:
## Paging

The *Paging* message is used for the notification of one or more UEs.

**Signalling radio bearer:** N/A  
**RLC-SAP:** TM  
**Logical channel:** PCCH  
**Direction:** E-UTRAN to UE

### Paging message

```asn1
Paging ::= SEQUENCE {
PagingRecordList          PagingRecordList OPTIONAL,  -- Need ON

...                       
}

PagingUE-Identity ::= CHOICE {
s-TMSI                    S-TMSI,
imsi                      IMSI,
...                       
}

IMSI ::= SEQUENCE (SIZE (6..21)) OF IMSI-Digit

IMSI-Digit ::= INTEGER (0..9)
```

-- ASN1STOP
Paging field descriptions

| cn-Domain | Indicates the origin of paging. |
| ue-Identity | Provides the NAS identity of the UE that is being paged. |
| systemInfoModification | If present: indication of a BCCH modification other than SIB10, SIB11 and SIB12. |
| etsw-Indication | If present: indication of an ETWS primary notification and/or ETWS secondary notification. |
| cmas-Indication | If present: indication of a CMAS notification. |
| imsi | The International Mobile Subscriber Identity, a globally unique permanent subscriber identity, see TS 23.003 [27]. The first element contains the first IMSI digit, the second element contains the second IMSI digit and so on. |

---

**ProximityIndication**

The **ProximityIndication** message is used to indicate that the UE is entering or leaving the proximity of one or more cells whose CSG IDs are in the UEs CSG whitelist.

Signalling radio bearer: SRB1

RLC-SAP: AM

Logical channel: DCCH

Direction: UE to E-UTRAN

---

**ProximityIndication message**

```asn1
ProximityIndication-r9 ::= SEQUENCE {
  criticalExtensions CHOICE {

        }
    },
    ...
}
```
**RRConnectionReconfiguration field descriptions**

**dedicatedInfoNASList**
This field is used to transfer UE specific NAS layer information between the network and the UE. The RRC layer is transparent for each PDU in the list.

**nas-securityParamToEUTRA**
This field is used to transfer UE specific NAS layer information between the network and the UE. The RRC layer is transparent for this field, although it affects activation of AS- security after inter-RAT handover to E-UTRA. The content is defined in TS 24.301.

**keyChangeIndicator**
‘true’ is used only in an intra-cell handover when a K_{eNB} key is derived from a native K_{ASME} key taken into use through the successful NAS SMC, as described in TS 33.401 [32] for K_{eNB} re-keying. ‘false’ is used in an intra-LTE handover when the new K_{eNB} key is obtained from the current K_{eNB} key or from the NH as described in TS 33.401 [32].

**nextHopChainingCount**
Parameter NCC: See TS 33.401 [32]

**fullConfig**
Indicates the full configuration option is applicable for the RRC Connection Reconfiguration message.

--- ASN1STOP

**RRCConnectionRelease field descriptions**

**releaseCause**
The `releaseCause` is used to indicate the reason for releasing the RRC Connection.

**redirectedCarrierInfo**
The `redirectedCarrierInfo` indicates a carrier frequency (downlink for FDD) and is used to redirect the UE to an E-UTRA or an inter-RAT carrier frequency, by means of the cell selection upon leaving RRC_CONNECTED as specified in TS 36.304 [4].

**idleModeMobilityControlInfo**
Provides dedicated cell reselection priorities. Used for cell reselection as specified in TS 36.304 [4].

**freqPriorityListX**
Provides a cell reselection priority for each frequency, by means of separate lists for each RAT (including E-UTRA).

**carrierFreq or bandClass**
The carrier frequency (UTRA and E-UTRA) and band class (HRPD and 1xRTT) for which the associated cellReselectionPriority is applied.

**t320**
Timer T320 as described in section 7.3. Value minN corresponds to N minutes.

**carrierFreqs**
The list of GERAN carrier frequencies organised into one group of GERAN carrier frequencies.

**systemInformation**
Container for system information of the GERAN cell. Each OCTET STRING in `SystemInfoListGERAN` contains one complete System Information (SI) message as defined in TS 44.018 [45, table 9.1.1].

**cellInfoList**
Used to provide system information of one or more cells on the redirected inter-RAT carrier frequency. The system information can be used if, upon redirection, the UE selects an inter-RAT cell indicated by the `physCellId` and `carrierFreq` (GERAN) or by the `physCellId` (other RATs). The choice shall match the `redirectedCarrierInfo`.

**utra-BCCH-Container**
Contains System Information Container message as defined in TS 25.331 [19].

}

RegisteredMME ::= SEQUENCE {
  plmn-Identity PLMN-Identity OPTIONAL,
  mmegi BIT STRING {SIZE (16)},
  mmec MMEC
}
```

**RRConnectionSetupComplete field descriptions**

- **selectedPLMN-Identity**
  Index of the PLMN selected by the UE from the `plmn-IdentityList` included in SIB1. 1 if the 1st PLMN is selected from the `plmn-IdentityList` included in SIB1, 2 if the 2nd PLMN is selected from the `plmn-IdentityList` included in SIB1 and so on.

- **registeredMME**
  This field is used to transfer the GUMMEI of the MME where the UE is registered, as provided by upper layers.

- **mmegi**
  Provides the Group Identity of the registered MME within the PLMN, as provided by upper layers, see TS 23.003 [27].

**SecurityModeCommand**

The **SecurityModeCommand** message is used to command the activation of AS security.
Signalling radio bearer: SRB1
RLC-SAP: AM
Logical channel: DCCH
Direction: E-UTRAN to UE

**SecurityModeCommand message**

```asn1
SecurityModeCommand ::= SEQUENCE {

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plmn-IdentityList</td>
<td>List of PLMN identities. The first listed PLMN-Identity is the primary PLMN.</td>
</tr>
<tr>
<td>cellReservedForOperatorUse</td>
<td>As defined in TS 36.304 [4].</td>
</tr>
<tr>
<td>trackingAreaCode</td>
<td>A trackingAreaCode that is common for all the PLMNs listed.</td>
</tr>
<tr>
<td>cellBarred</td>
<td>‘barred’ means the cell is barred, as defined in TS 36.304 [4].</td>
</tr>
<tr>
<td>intraFreqReselection</td>
<td>Used to control cell reselection to intra-frequency cells when the highest ranked cell is barred, or treated as barred by the UE, as specified in TS 36.304 [4].</td>
</tr>
<tr>
<td>csg-Indication</td>
<td>If set to TRUE the UE is only allowed to access the cell if the CSG identity matches an entry in the CSG whitelist that the UE has stored.</td>
</tr>
<tr>
<td>q-RxLevMinOffset</td>
<td>Parameter $Q_{\text{rxlevminoffset}}$ in TS 36.304 [4]. Actual value $Q_{\text{rxlevminoffset}} = IE$ value * 2 [dB]. If absent, the UE applies the (default) value of 0 dB for $Q_{\text{rxlevminoffset}}$. Affects the minimum required Rx level in the cell.</td>
</tr>
<tr>
<td>p-Max</td>
<td>Value applicable for the cell. If absent the UE applies the maximum power according to the UE capability.</td>

---

**UEInformationResponse field descriptions**

- **numberOfPreamblesSent**
  This field is used to indicate the number of RACH preambles that were transmitted. Corresponds to parameter PREAMBLE_TRANSMISSION_COUNTER in TS 36.321 [6].

- **contentionDetected**
  This field is used to indicate that contention was detected for at least one of the transmitted preambles, see also [6].

- **measResultLastServCell**
  This field refers to the last measurement results taken in the serving cell, where radio link failure happened.
ULHandoverPreparationTransfer (CDMA2000)

The ULHandoverPreparationTransfer message is used for the uplink transfer of handover related CDMA2000 information when requested by the higher layers.

Signalling radio bearer: SRB1

RLC-SAP: AM

Logical channel: DCCH

Direction: UE to E-UTRAN

**ULHandoverPreparationTransfer message**

```asn1
ULHandoverPreparationTransfer ::= SEQUENCE {
  criticalExtensions  CHOICE {
    c1  CHOICE {
      ulHandoverPreparationTransfer-r8  ULHandoverPreparationTransfer-r8-IEs,
      spare3 NULL, spare2 NULL, spare1 NULL
    },
    criticalExtensionsFuture  SEQUENCE {}
  }
}

ULHandoverPreparationTransfer-r8-IEs ::= SEQUENCE {
  cdma2000-Type  CDMA2000-Type,
  meid  BIT STRING (SIZE (56)) OPTIONAL,
  dedicatedInfo  DedicatedInfoCDMA2000,
  nonCriticalExtension  ULHandoverPreparationTransfer-v8a0-IEs
                          OPTIONAL
}

ULHandoverPreparationTransfer-v8a0-IEs ::= SEQUENCE {
  lateR8NonCriticalExtension  OCTET STRING
                          OPTIONAL,
  nonCriticalExtension  SEQUENCE {}
                          OPTIONAL
}
```

**ULHandoverPreparationTransfer field descriptions**

- **meid**
  The 56 bit mobile identification number provided by the CDMA2000 Upper layers.

ULInformationTransfer

The ULInformationTransfer message is used for the uplink transfer of dedicated NAS information.

Signalling radio bearer: SRB2 or SRB1 (only if SRB2 not established yet). If SRB2 is suspended, the UE does not send this message until SRB2 is resumed.

RLC-SAP: AM

Logical channel: DCCH

Direction: UE to E-UTRAN

**ULInformationTransfer message**

```asn1
ULInformationTransfer ::= SEQUENCE {
  criticalExtensions  CHOICE {
    c1  CHOICE {
      ulInformationTransfer-r8  ULInformationTransfer-r8-IEs,
      spare3 NULL, spare2 NULL, spare1 NULL
    },
  }
}
```

---
6.3 RRC information elements

6.3.1 System information blocks

– SystemInformationBlockType2

The IE SystemInformationBlockType2 contains radio resource configuration information that is common for all UEs.

NOTE: UE timers and constants related to functionality for which parameters are provided in another SIB are included in the corresponding SIB.

SystemInformationBlockType2 information element

-- ASN1START

SystemInformationBlockType2 ::= SEQUENCE {

-- ASN1STOP
### SystemInformationBlockType2 field descriptions

**ac-BarringForEmergency**  
Access class barring for AC 10.

**ac-BarringForMO-Signalling**  
Access class barring for mobile originating signalling.

**ac-BarringForMO-Data**  
Access class barring for mobile originating calls.

**ac-BarringFactor**  
If the random number drawn by the UE is lower than this value, access is allowed. Otherwise the access is barred.  
The values are interpreted in the range [0, 1): p00 = 0, p05 = 0.05, p10 = 0.10, ..., p95 = 0.95.

**ac-BarringTime**  
Mean access barring time value in seconds.

**ul-CarrierFreq**  
Access class barring for AC 11-15. The first/ leftmost bit is for AC 11, the second bit is for AC 12, and so on.

**ul-Bandwidth**  
Parameter: transmission bandwidth configuration, N_{n6}, in uplink, see TS 36.101 [42, table 5.7.3-1] applies.  
For TDD: This parameter is absent and it is equal to the downlink frequency.

**mbsfn-SubframeConfigList**  
Defines the subframes that are reserved for MBSFN in downlink.

**ssac-BarringForMMTEL-Voice**  
Service specific access class barring for MMTEL voice originating calls.

**ssac-BarringForMMTEL-Video**  
Service specific access class barring for MMTEL video originating calls.

---

### SystemInformationBlockType3

The IE `SystemInformationBlockType3` contains cell re-selection information common for intra-frequency, inter-frequency and/or inter-RAT cell re-selection (i.e., applicable for more than one type of cell re-selection but not necessarily all) as well as intra-frequency cell re-selection information other than neighbouring cell related.

SystemInformationBlockType3 field descriptions

**cellReselectionInfoCommon**
Cell re-selection information common for cells.

**q-Hyst**
Parameter $Q_{hyst}$ in 36.304 [4]. Value in dB. Value dB1 corresponds to 1 dB, dB2 corresponds to 2 dB and so on.

**speedStateReselectionPars**
Speed dependent reselection parameters, see TS 36.304 [4]. If this field is absent, i.e, mobilityStateParameters is also not present, UE behaviour is specified in TS 36.304 [4].

**q-HystSF**
Parameter “Speed dependent ScalingFactor for $Q_{hyst}$” in TS 36.304 [4]. The sf-Medium and sf-High concern the additional hysteresis to be applied, in Medium and High Mobility state respectively, to $Q_{hyst}$ as defined in TS 36.304 [4]. In dB. Value dB-6 corresponds to -6dB, dB-4 corresponds to -4dB and so on.

**t-ReselectionEUTRA**
Parameter “TreselectionEUTRA” in TS 36.304 [4].

**t-ReselectionEUTRA-SF**
Parameter “Speed dependent ScalingFactor for TreselectionEUTRA” in TS 36.304 [4]. If the field is not present, the UE behaviour is specified in TS 36.304 [4].

**q-RxLevMin**
Parameter “$Q_{rxlevmin}$” in TS 36.304 [4], applicable for intra-frequency neighbour cells.

**s-IntraSearch**
Parameter “$S_{intraSearch}$” in TS 36.304 [4]. If the field $s$-IntraSearchP is present, the UE applies the value of $s$-IntraSearchP instead. Otherwise if neither $s$-IntraSearch nor $s$-IntraSearchP is present, the UE applies the (default) value of infinity for $S_{intraSearchP}$.

**cellReselectionServingFreqInfo**
Information common for Cell re-selection to inter-frequency and inter-RAT cells.

**s-NonIntraSearch**
Parameter “$S_{nonIntraSearch}$” in TS 36.304 [4]. If the field $s$-NonIntraSearchP is present, the UE applies the value of $s$-NonIntraSearchP instead. Otherwise if neither $s$-NonIntraSearch nor $s$-NonIntraSearchP is present, the UE applies the (default) value of infinity for $S_{nonIntraSearchP}$.

**threshServingLow**
Parameter “$ThreshServingLow$” in TS 36.304 [4].

**intraFreqCellReselectionInfo**
Cell re-selection information common for intra-frequency cells.

**p-Max**
Value applicable for the intra-frequency neighbouring E-UTRA cells. If absent the UE applies the maximum power according to the UE capability.

**allowedMeasBandwidth**
If absent, the value corresponding to the downlink bandwidth indicated by the $dl$-Bandwidth included in MasterInformationBlock applies.

**s-IntraSearchP**
Parameter “$S_{intraSearchP}$” in TS 36.304 [4]. See descriptions under $s$-IntraSearch.

**s-IntraSearchQ**
Parameter “$S_{intraSearchQ}$” in TS 36.304 [4]. If the field is not present, the UE applies the (default) value of 0 dB for $S_{intraSearchQ}$.

**s-NonIntraSearchP**
Parameter “$S_{nonIntraSearchP}$” in TS 36.304 [4]. See descriptions under $s$-NonIntraSearch.

**s-NonIntraSearchQ**
Parameter “$S_{nonIntraSearchQ}$” in TS 36.304 [4]. If the field is not present, the UE applies the (default) value of 0 dB for $S_{nonIntraSearchQ}$.

**q-QualMin**
Parameter “$Q_{qualmin}$” in TS 36.304 [4], applicable for intra-frequency neighbour cells. If the field is not present, the UE applies the (default) value of negative infinity for $Q_{qualmin}$.

**threshServingLowQ**
Parameter “$ThreshServingLowQ$” in TS 36.304 [4].

---

**SystemInformationBlockType4**

The IE SystemInformationBlockType4 contains neighbouring cell related information relevant only for intra-frequency cell re-selection. The IE includes cells with specific re-selection parameters as well as blacklisted cells.

**SystemInformationBlockType4 information element**

```
-- ASN1START
SystemInformationBlockType4 ::= SEQUENCE {
    intraFREQNeighCellList IntraFREQNeighCellList OPTIONAL, -- Need OR

-- ASN1END
```
IntraFreqNeighCellList ::= SEQUENCE (SIZE (1..maxCellIntra)) OF IntraFreqNeighCellInfo

IntraFreqBlackCellList ::= SEQUENCE (SIZE (1..maxCellBlack)) OF PhysCellIdRange

-- ASN1STOP

SystemInformationBlockType4 field descriptions

intraFreqNeighCellList
List of intra-frequency neighbouring cells with specific cell re-selection parameters.

q-OffsetCell
Parameter "Offset," in TS 36.304 [4].

intraFreqBlackCellList
List of blacklisted intra-frequency neighbouring cells.

csg-PhysCellIdRange
Set of physical cell identities reserved for CSG cells on the frequency on which this field was received. The received csg-PhysCellIdRange applies if less than 24 hours has elapsed since it was received and it was received in the same primary PLMN. The 3 hour validity restriction (section 5.2.1.3) does not apply to this field.

Conditional presence Explanation

CSG This field is optional, need OP, for non-CSG cells, and mandatory for CSG cells.

-- SystemInformationBlockType5

The IE SystemInformationBlockType5 contains information relevant only for inter-frequency cell re-selection i.e. information about other E-UTRA frequencies and inter-frequency neighbouring cells relevant for cell re-selection. The IE includes cell re-selection parameters common for a frequency as well as cell specific re-selection parameters.

SystemInformationBlockType5 field descriptions

p-Max
Value applicable for the neighbouring E-UTRA cells on this carrier frequency. If absent the UE applies the maximum power according to the UE capability.

threshX-High

threshX-Low

t-ReselectionEUTRA
Parameter “TreselectionEUTRA” in TS 36.304 [4].

q-OffsetFreq
Parameter “Qoffsetfrequency” in TS 36.304 [4].

interFreqNeighCellList
List of inter-frequency neighbouring cells with specific cell re-selection parameters.

q-OffsetCell
Parameter “Qoffsets,n” in TS 36.304 [4].

interFreqBlackCellList
List of blacklisted inter-frequency neighbouring cells.

q-QualMin
Parameter “Qqualmin” in TS 36.304 [4]. If the field is not present, the UE applies the (default) value of negative infinity for Qqualmin.

threshX-HighQ
Parameter “ThreshX,HighQ” in TS 36.304 [4].

threshX-LowQ
Parameter “ThreshX,LowQ” in TS 36.304 [4].

Conditional presence Explanation
RSRQ The field is mandatory present if threshServingLowQ is present in systemInformationBlockType3; otherwise it is not present.

-- SystemInformationBlockType6

The IE SystemInformationBlockType6 contains information relevant only for inter-RAT cell re-selection i.e. information about UTRA frequencies and UTRA neighbouring cells relevant for cell re-selection. The IE includes cell re-selection parameters common for a frequency.

SystemInformationBlockType6 information element

    threshX-High  ReselectionThreshold,
    threshX-Low  ReselectionThreshold
  }
  ...
}
-- ASN1STOP
```

SystemInformationBlockType7 field descriptions

carrierFreqsInfoList
- Provides a list of neighbouring GERAN carrier frequencies, which may be monitored for neighbouring GERAN cells. The GERAN carrier frequencies are organised in groups and the cell reselection parameters are provided per group of GERAN carrier frequencies.

carrierFreqs
- The list of GERAN carrier frequencies organised into one group of GERAN carrier frequencies.

commonInfo
- Defines the set of cell reselection parameters for the group of GERAN carrier frequencies.

t-ReselectionGERAN
- Parameter “TreselectionGERAN” in TS 36.304 [4].

t-ReselectionGERAN-SF
- Parameter “Speed dependent ScalingFactor for TreselectionGERAN” in TS 36.304 [4]. If the field is not present, the UE behaviour is specified in TS 36.304 [4].
ncc-Permitted
- Field encoded as a bit map, where bit N is set to “0” if a BCCH carrier with NCC = N-1 is not permitted for monitoring and set to “1” if the BCCH carrier with NCC = N-1 is permitted for monitoring; N = 1 to 8; bit 1 of the bitmap is the leading bit of the bit string.

g-RxLevMin
- Parameter “Q_{rxlevmin}” in TS 36.304 [1], minimum required RX level in the GSM cell. The actual value of Q_{rxlevmin} in dBm = (IE value * 2) – 115.
p-MaxGERAN
- Maximum allowed transmission power for GERAN on an uplink carrier frequency, see TS 45.008 [28]. Value in dBm. Applicable for the neighbouring GERAN cells on this carrier frequency. If pmaxGERAN is absent, the maximum power according to the UE capability is used.

threshX-High
- Parameter “Thresh_{X, High}” in TS 36.304 [4].

threshX-Low
- Parameter “Thresh_{X, Low}” in TS 36.304 [4].

SystemInformationBlockType8

The IE SystemInformationBlockType8 contains information relevant only for inter-RAT cell re-selection i.e. information about CDMA2000 frequencies and CDMA2000 neighbouring cells relevant for cell re-selection. **systemTimeInfo**
Information on CDMA2000 system time. This field is required for a UE with \texttt{rx-ConfigHRPD= 'single' and/ or rx-Config1XRTT= 'single'} to perform handover, cell re-selection, UE measurement based redirection and enhanced 1xRTT CS fallback from E-UTRAN to CDMA2000 according to this specification and TS 36.304 [4]. This field is excluded when estimating changes in system information, i.e. changes of \texttt{systemTimeInfo} should neither result in system information change notifications nor in a modification of \texttt{systemInfoValueTag} in SIB1.

**searchWindowSize**
The search window size is a CDMA2000 parameter to be used to assist in searching for the neighbouring pilots. For values see C.S0005-A [25, Table 2.6.6.2.1-1] and C.S0024-A [26, Table 8.7.6.2-4]. This field is required for a UE with \texttt{rx-ConfigHRPD= 'single' and/ or rx-Config1XRTT= 'single'} to perform handover, cell re-selection, UE measurement based redirection and enhanced 1xRTT CS fallback from E-UTRAN to CDMA2000 according to this specification and TS 36.304 [4].

**parametersHRPD**
Parameters applicable only for interworking with CDMA2000 HRPD systems.

**preRegistrationInfoHRPD**
The CDMA2000 HRPD Pre-Registration Information tells the UE if it should pre-register with the CDMA2000 HRPD network and identifies the Pre-registration zone to the UE.

**cellReselectionParametersHRPD**
Cell reselection parameters applicable for cell reselection to CDMA2000 HRPD system

**bandClassList**
List of CDMA2000 frequency bands.

**bandClass**
Identifies the Frequency Band in which the Carrier can be found. Details can be found in C.S0057-B [24, Table 1.5].

**threshX-High**
Parameter “\texttt{Thresh\_X,\_HighP}” in TS 36.304 [4]. This specifies the high threshold used in reselection towards this CDMA2000 band class expressed as an unsigned binary number equal to FLOOR (-2 x 10 \times \log_{10} \frac{E_c}{I_o}) in units of 0.5 dB, as defined in C.S0005-A [25].

**threshX-Low**
Parameter “\texttt{Thresh\_X,\_LowP}” in TS 36.304 [4]. This specifies the low threshold used in reselection towards this CDMA2000 band class expressed as an unsigned binary number equal to FLOOR (-2 x 10 \times \log_{10} \frac{E_c}{I_o}) in units of 0.5 dB, as defined in C.S0005-A [25].

**t-ReselectionCDMA2000**
Parameter “\texttt{Treselection\_CDMA\_HRPD}” or “\texttt{Treselection\_CDMA\_1xRTT}” in TS 36.304 [4].

**t-ReselectionCDMA2000-SCF**
Parameter “\texttt{Speed dependent ScalingFactor for Treselection\_CDMA\_HRPD}” or “\texttt{Treselection\_CDMA\_1xRTT}” in TS 36.304 [4]. If the field is not present, the UE behaviour is specified in TS 36.304 [4].

**neighCellList**
List of CDMA2000 neighbouring cells. The total number of neighbouring cells in neighCellList for each RAT (1XRTT or HRPD) is limited to 32.

**parameters1XRTT**
Parameters applicable for interworking with CDMA2000 1XRTT system.
## SystemInformationBlockType8 field descriptions

### csfb-RegistrationParam1XRTT
Contains the parameters the UE will use to determine if it should perform a CDMA2000 1xRTT Registration/Re-Registration. This field is included if either CSFB or enhanced CS fallback to CDMA2000 1xRTT is supported.

### longCodeState1XRTT
The state of long code generation registers in CDMA2000 1xRTT system as defined in C.S0002-A [12, Section 1.3] at \[t / 10 \times 10 + 320 \text{ ms}, where t equals to the cdma-SystemTime. This field is required for SRVCC handover and enhanced CS fallback to CDMA2000 1xRTT operation. Otherwise this IE is not needed. This field is excluded when estimating changes in system information, i.e. changes of longCodeState1XRTT should neither result in system information change notifications nor in a modification of systemInfoValueTag in SIB1.

### cellReselectionParameters1XRTT
Cell reselection parameters applicable only to CDMA2000 1xRTT system.

### neighCellsPerFreqList

### physCellIdList

### csfb-SupportForDualRxUEs
Value TRUE indicates that the network supports dual Rx CSFB [51].

### cellReselectionParametersHRPD-v920
Cell reselection parameters applicable for cell reselection to CDMA2000 HRPD system. The field is not present if cellReselectionParametersHRPD is not present; otherwise it is optionally present.

### cellReselectionParameters1XRTT-v920
Cell reselection parameters applicable for cell reselection to CDMA2000 1xRTT system. The field is not present if cellReselectionParameters1XRTT is not present; otherwise it is optionally present.

### neighCellList-v920
Extended List of CDMA2000 neighbouring cells. The combined total number of CDMA2000 neighbouring cells in both neighCellList and neighCellList-v920 is limited to 32 for HRPD and 40 for 1xRTT.

### neighCellsPerFreqList-v920
Extended list of neighbour cell ids, in the same CDMA2000 Frequency Band as the corresponding instance in “NeighCellListCDMA2000”.

### physCellIdList-v920
Extended list of CDMA2000 cell ids, in the same CDMA2000 ARFCN as the corresponding instance in “NeighCellsPerBandclassCDMA2000”.

### ac-BarringConfig1XRTT
Contains the access class barring parameters the UE uses to calculate the access class barring factor, according to the equations for \( P \) in C.S0004-A [34]. If the random number drawn by the UE is lower than the access class barring factor, triggering the voice call origination, SMS origination or registration is allowed; otherwise it is barred.

### ac-Barring0to9
Parameter used for calculating the access class barring factor for access overload classes 0 through 9. It is the parameter “PSIST” in C.S0004-A [34] for access overload classes 0 through 9.

### ac-BarringN
Parameter used for calculating the access class barring factor for access overload class N (N = 10 to 15). It is the parameter “PSIST” in C.S0004-A [34] for access overload class N.

### ac-BarringMsg
Parameter used for modifying the access class barring factor for message transmissions. It is the parameter “MSG_PSIST” in C.S0004-A [34].

### ac-BarringReg
Parameter used for modifying the access class barring factor for autonomous registrations. It is the parameter “REG_PSIST” in C.S0004-A [34].

### ac-BarringEmg
Parameter used for calculating the access class barring factor for emergency calls and emergency message transmissions for access overload classes 0 through 9. It is the parameter “PSIST_EMG” in C.S0004-A [34].

The IE SystemInformationBlockType9 contains a home eNB name (HNB Name).

**SystemInformationBlockType9 information element**

```
SystemInformationBlockType9 ::= SEQUENCE {
    hnb-Name             OCTET STRING (SIZE(1..48))  OPTIONAL,  -- Need OR
    ...,lateR8NonCriticalExtension OCTET STRING OPTIONAL  -- Need OP
}
```

**SystemInformationBlockType9 field descriptions**

**hnb-Name**
Carries the name of the home eNB, coded in UTF-8 with variable number of bytes per character, see TS 22.011 [10].

The IE SystemInformationBlockType10 contains an ETWS primary notification.

**SystemInformationBlockType10 information element**

```
SystemInformationBlockType10 ::= SEQUENCE {
    messageIdentifier  BIT STRING (SIZE (16)),
    serialNumber       BIT STRING (SIZE (16)),
    warningType        OCTET STRING (SIZE (2))  OPTIONAL,  -- Need OP
    warningSecurityInfo OCTET STRING (SIZE (50)) OPTIONAL  -- Need OP
    ...,lateR8NonCriticalExtension OCTET STRING OPTIONAL  -- Need OP
}
```

**SystemInformationBlockType10 field descriptions**

**messageIdentifier**
Identifies the source and type of ETWS notification. The leading bit (which is equivalent to the leading bit of the equivalent IE defined in TS 36.413 [39, 9.2.1.44]) contains bit 7 of the first octet of the equivalent IE, defined in and encoded according to TS 23.041 [37, 9.4.1.2.2], while the trailing bit contains bit 0 of the second octet of the same equivalent IE.

**serialNumber**
Identifies variations of an ETWS notification. The leading bit (which is equivalent to the leading bit of the equivalent IE defined in TS 36.413 [39, 9.2.1.45]) contains bit 7 of the first octet of the equivalent IE, defined in and encoded according to TS 23.041 [37, 9.4.1.2.1], while the trailing bit contains bit 0 of the second octet of the same equivalent IE.

**warningType**
Identifies the warning type of the ETWS primary notification and provides information on emergency user alert and UE popup. The first octet (which is equivalent to the first octet of the equivalent IE defined in TS 36.413 [39, 9.2.1.50]) contains the first octet of the equivalent IE defined in and encoded according to TS 23.041 [37, 9.3.24], and so on.

**warningSecurityInfo**
Provides security information for the ETWS notification. The first octet (which is equivalent to the first octet of the equivalent IE defined in TS 36.413 [39, 9.2.1.51]) contains the first octet of the equivalent IE defined in and encoded according to TS 23.041 [37, 9.3.25], and so on.
-- SystemInformationBlockType11

The IE SystemInformationBlockType11 contains a ETWS secondary notification.

SystemInformationBlockType11 information element

-- ASN1START

SystemInformationBlockType11 ::= SEQUENCE {
    messageIdentifier BIT STRING (SIZE (16)),
    serialNumber BIT STRING (SIZE (16)),

    warningMessageSegmentNumber INTEGER (0..63),
    warningMessageSegment OCTET STRING,
    dataCodingScheme OCTET STRING (SIZE (1)) OPTIONAL, -- Cond Segment1
    ...,
    lastR8NonCriticalExtension OCTET STRING OPTIONAL -- Need OP
}

-- ASN1STOP

SystemInformationBlockType11 field descriptions

messageIdentifier

Identifies the source and type of ETWS notification. The leading bit (which is equivalent to the leading bit of the equivalent IE defined in TS 36.413 [39, 9.2.1.44]) contains bit 7 of the first octet of the equivalent IE, defined in and encoded according to TS 23.041 [37, 9.4.1.2.2], while the trailing bit contains bit 0 of second octet of the same equivalent IE.

serialNumber

Identifies variations of an ETWS notification. The leading bit (which is equivalent to the leading bit of the equivalent IE defined in TS 36.413 [39, 9.2.1.45]) contains bit 7 of the first octet of the equivalent IE, defined in and encoded according to TS 23.041 [37, 9.4.1.2.1], while the trailing bit contains bit 0 of second octet of the same equivalent IE.

warningMessageSegmentType

Indicates whether the included ETWS warning message segment is the last segment or not.

warningMessageSegmentNumber

Segment number of the ETWS warning message segment contained in the SIB. A segment number of zero corresponds to the first segment, one corresponds to the second segment, and so on.

warningMessageSegment

Carries a segment of the Warning Message Contents IE defined in TS 36.413 [39, 9.2.1.53]. The first octet of the Warning Message Contents IE is equivalent to the first octet of the CB data IE defined in and encoded according to TS 23.041 [37, 9.4.2.2.5] and so on.

dataCodingScheme

Identifies the alphabet/coding and the language applied variations of an ETWS notification. The octet (which is equivalent to the octet of the equivalent IE defined in TS 36.413 [39, 9.2.1.52]) contains the octet of the equivalent IE defined in TS 23.041 [37, 9.3.2.2.4] and encoded according to TS 23.038 [38].

Conditional presence

| Segment1 | The field is mandatory present in the first segment of SIB11, otherwise it is not present. |

-- SystemInformationBlockType12

The IE SystemInformationBlockType12 contains a CMAS notification.

SystemInformationBlockType12 information element

-- ASN1START

SystemInformationBlockType12-r9 ::= SEQUENCE {
    messageIdentifier-r9 BIT STRING (SIZE (16)),
    serialNumber-r9 BIT STRING (SIZE (16)),

    warningMessageSegmentNumber-r9 INTEGER (0..63),
    warningMessageSegment-r9 OCTET STRING,
    dataCodingScheme-r9 OCTET STRING (SIZE (1)) OPTIONAL, -- Cond Segment1
    lateR9NonCriticalExtension OCTET STRING OPTIONAL, -- Need OP
SystemInformationBlockType12 field descriptions

**messageIdentifier**
Identifies the source and type of CMAS notification. The leading bit (which is equivalent to the leading bit of the equivalent IE defined in TS 36.413 [39, 9.2.1.44]) contains bit 7 of the first octet of the equivalent IE, defined in and encoded according to TS 23.041 [37, 9.4.1.2.2], while the trailing bit contains bit 0 of second octet of the same equivalent IE.

**serialNumber**
Identifies variations of a CMAS notification. The leading bit (which is equivalent to the leading bit of the equivalent IE defined in TS 36.413 [39, 9.2.1.45]) contains bit 7 of the first octet of the equivalent IE, defined in and encoded according to TS 23.041 [37, 9.4.1.2.1], while the trailing bit contains bit 0 of second octet of the same equivalent IE.

**warningMessageSegmentType**
Indicates whether the included CMAS warning message segment is the last segment or not.

**warningMessageSegmentNumber**
Segment number of the CMAS warning message segment contained in the SIB. A segment number of zero corresponds to the first segment, one corresponds to the second segment, and so on.

**warningMessageSegment**
Carries a segment of the Warning Message Contents IE defined in TS 36.413 [39]. The first octet of the Warning Message Contents IE is equivalent to the first octet of the CB data IE defined in and encoded according to TS 23.041 [37, 9.4.2.2.5] and so on.

**dataCodingScheme**
Identifies the alphabet/coding and the language applied variations of a CMAS notification. The octet (which is equivalent to the octet of the equivalent IE defined in TS 36.413 [39, 9.2.1.52]) contains the octet of the equivalent IE defined in TS 23.041 [37, 9.3.2.2.4] and encoded according to TS 23.038 [38].

**SystemInformationBlockType13 field descriptions**

6.3.2 Radio resource control information elements

---

**AntennaInfo**

The IE `AntennaInfoCommon` and the `AntennaInfoDedicated` are used to specify the common and the UE specific antenna configuration respectively.

### AntennaInfo information elements

```asn1
```
AntennaInfoCommon ::= SEQUENCE {
  antennaPortsCount ENUMERATED {an1, an2, an4, spare1}
}

AntennaInfoDedicated ::= SEQUENCE {
  transmissionMode ENUMERATED {
    tm1, tm2, tm3, tm4, tm5, tm6, tm7, tm8-v920,
  }{
  codebookSubsetRestriction CHOICE {
    n2TxAntenna-tm3 BIT STRING (SIZE (2)),
    n4TxAntenna-tm3 BIT STRING (SIZE (4)),
    n2TxAntenna-tm4 BIT STRING (SIZE (6)),
    n4TxAntenna-tm4 BIT STRING (SIZE (64)),
    n2TxAntenna-tm5 BIT STRING (SIZE (4)),
    n4TxAntenna-tm5 BIT STRING (SIZE (16)),
    n2TxAntenna-tm6 BIT STRING (SIZE (4)),
    n4TxAntenna-tm6 BIT STRING (SIZE (16))
  } OPTIONAL,
  ue-TransmitAntennaSelection CHOICE {
    release NULL,
    setup ENUMERATED {closedLoop, openLoop}
  }
}

AntennaInfoDedicated-v920 ::= SEQUENCE {
  codebookSubsetRestriction-v920 CHOICE {
    n2TxAntenna-tm8-r9 BIT STRING (SIZE (6)),
    n4TxAntenna-tm8-r9 BIT STRING (SIZE (32))
  } OPTIONAL
}

-- ASN1STOP

AntennaInfo field descriptions

**antennaPortsCount**
Parameter represents the number of cell specific antenna ports where an1 corresponds to 1, an2 to 2 antenna ports etc. see TS 36.211 [21, 6.2.1].

**transmissionMode**
Points to one of Transmission modes defined in TS 36.213 [23, 7.1] where tm1 refers to transmission mode 1, tm2 to transmission mode 2 etc.

**codebookSubsetRestriction**
Parameter: codebookSubsetRestriction, see TS 36.213 [23, 7.2] and TS 36.211 [21, 6.3.4.2.3]. The field codebookSubsetRestriction-v920 is applicable only if PMI/RI reporting is configured.

**ue-TransmitAntennaSelection**
For value setup the field indicates whether UE transmit antenna selection control is closed-loop or open-loop as described in TS 36.213 [23, 8.7].

<table>
<thead>
<tr>
<th>Conditional presence</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>TM</strong></td>
<td>The field is mandatory present if the transmissionMode is set to tm3, tm4, tm5 or tm6. Otherwise the field is not present and the UE shall delete any existing value for this field.</td>
</tr>
<tr>
<td><strong>TM8</strong></td>
<td>The field is optional present, need OR, if AntennaInfoDedicated is included and transmissionMode is set to tm8. If AntennaInfoDedicated is included and transmissionMode is set to a value other than tm8, the field is not present and the UE shall delete any existing value for this field. Otherwise the field is not present and the UE takes no action i.e. continues to use the existing value, if previously configured.</td>
</tr>
</tbody>
</table>

---

**CQI-ReportConfig**
The IE CQI-ReportConfig is used to specify the CQI reporting configuration.

**CQI-ReportConfig** information elements

-- ASN1START

CQI-ReportConfig ::= SEQUENCE {
  cqi-ReportModeAperiodic ENUMERATED {
    rm12, rm20, rm22, rm30, rm31, spare3, spare2, spare1} OPTIONAL, -- Need OR
}

-- ASN1STOP
CQI-ReportConfig field descriptions

cqi-PUCCH-ResourceIndex
Parameter $n_{\text{PUCCH}}^{(2)}$, see TS 36.213 [23, 7.2].

cqi-pmi-ConfigIndex
Parameter: CQI/PMI Periodicity and Offset Configuration Index $l_{\text{CQI/PMI}}$, see TS 36.213 [23, tables 7.2.2-1A and 7.2.2-1C].

ri-ConfigIndex
Parameter: RI Config Index $l_{\text{RI}}$, see TS 36.213 [23, 7.2.2-1B].

K
Parameter: K, see TS 36.213 [23, 7.2.2].

cqi-FormatIndicatorPeriodic
Parameter: PUCCH CQI Feedback Type, see TS 36.213 [23, table 7.2.2-1]. Depending on transmissionMode, reporting mode is implicitly given from the table.

simultaneousAckNackAndCQI
Parameter: Simultaneous-AN-and-CQI. see TS 36.213 [23, 10.1] TRUE indicates that simultaneous transmission of ACK/NACK and CQI is allowed.

cqi-ReportModeAperiodic
Parameter: reporting mode. Value m12 corresponds to Mode 1-2, m20 corresponds to Mode 2-0, m22 corresponds to Mode 2-2 etc. PUSCH reporting modes are described in TS 36.213 [23, 7.2.1].

nomPDSCH-RS-EPRE-Offset
Parameter: $\Delta_{\text{offset}}$, see TS 36.213 [23, 7.2.3]. Actual value = IE value * 2 [dB].

cqi-Mask
Limits CQI/PMI/RI reports to the on-duration period of the DRX cycle, see TS 36.321 [6].

pmi-RI-Report
See TS 36.213 [23, 7.2]. The presence of this field means PMI/RI reporting is configured, which is applicable only when transmissionMode is set to tm8; otherwise PMI/RI reporting is not configured.

<table>
<thead>
<tr>

</tbody>
</table>
DRB-Identity

The IE *DRB-Identity* is used to identify a DRB used by a UE.

**DRB-Identity information elements**

```
-- ASN1START
DRB-Identity ::= INTEGER (1..32)
-- ASN1STOP
```

LogicalChannelConfig

The IE *LogicalChannelConfig* is used to configure the logical channel parameters.

**LogicalChannelConfig information element**

```
-- ASN1START
LogicalChannelConfig ::= SEQUENCE {
  ul-SpecificParameters  SEQUENCE {
    priority       INTEGER (1..16),
    prioritisedBitRate ENUMERATED {
      kBps0, kBps8, kBps16, kBps32, kBps64, kBps128,
      kBps256, infinity, spare8, spare7, spare6,
      spare5, spare4, spare3, spare2, spare1},
    bucketSizeDuration ENUMERATED {
      ms50, ms100, ms150, ms300, ms500, ms1000, spare2,
      spare1},
  }
  logicalChannelGroup INTEGER (0..3) OPTIONAL -- Need OR
  logicalChannelSR-Mask-r9 ENUMERATED {setup} OPTIONAL -- Cond SRmask
}
-- ASN1STOP
```

**LogicalChannelConfig field descriptions**

- **priority**
  Logical channel priority in TS 36.321 [6]. Value is an integer.

- **prioritisedBitRate**
  Prioritized Bit Rate for logical channel prioritization in TS 36.321 [6]. Value in kilobytes/second. Value kBps0 corresponds to 0 kB/second, kBps8 corresponds to 8 kB/second, kBps16 corresponds to 16 kB/second and so on. Infinity is the only applicable value for SRB1 and SRB2.

- **bucketSizeDuration**
  Bucket Size Duration for logical channel prioritization in TS 36.321 [6]. Value in milliseconds. Value ms50 corresponds to 50 ms, ms100 corresponds to 100 ms and so on.

- **logicalChannelGroup**
  Mapping of logical channel to logical channel group for BSR reporting in TS 36.321 [6].

- **logicalChannelSR-Mask**
  Controlling SR triggering on a logical channel basis when an uplink grant is configured. See TS 36.321 [6].

**Conditional presence**

    }
}
```
MAC-MainConfig field descriptions

maxHARQ-Tx
Maximum number of transmissions for UL HARQ in TS 36.321 [6].

periodicBSR-Timer
Timer for BSR reporting in TS 36.321 [6]. Value in number of sub-frames. Value sf10 corresponds to 10 sub-frames, sf20 corresponds to 20 sub-frames and so on.

retxBSR-Timer
Timer for BSR reporting in TS 36.321 [6]. Value in number of sub-frames. Value sf640 corresponds to 640 sub-frames, sf1280 corresponds to 1280 sub-frames and so on.

ttiBundling
TRUE indicates that TTI bundling TS 36.321 [6] is enabled while FALSE indicates that TTI bundling is disabled. TTI bundling can be enabled for FDD and for TDD only for configurations 0, 1 and 6. For TDD, E-UTRAN does not simultaneously enable TTI bundling and semi-persistent scheduling in this release of specification.

longDRX-CycleStartOffset
longDRX-Cycle and drxStartOffset in TS 36.321 [6]. The value of longDRX-Cycle is in number of sub-frames. Value sf10 corresponds to 10 sub-frames, sf20 corresponds to 20 sub-frames and so on. If shortDRX-Cycle is configured, the value of longDRX-Cycle shall be a multiple of the shortDRX-Cycle value. The value of drxStartOffset value is in number of sub-frames.

onDurationTimer
Timer for DRX in TS 36.321 [6]. Value in number of PDCCH sub-frames. Value psf1 corresponds to 1 PDCCH sub-frame, psf2 corresponds to 2 PDCCH sub-frames and so on.

drx-InactivityTimer
Timer for DRX in TS 36.321 [6]. Value in number of PDCCH sub-frames. Value psf1 corresponds to 1 PDCCH sub-frame, psf2 corresponds to 2 PDCCH sub-frames and so on.

drx-RetransmissionTimer
Timer for DRX in TS 36.321 [6]. Value in number of PDCCH sub-frames. Value psf1 corresponds to 1 PDCCH sub-frame, psf2 corresponds to 2 PDCCH sub-frames and so on.

shortDRX-Cycle
Short DRX cycle in TS 36.321 [6]. Value in number of sub-frames. Value sf2 corresponds to 2 sub-frames, sf5 corresponds to 5 subframes and so on.

drxShortCycleTimer

periodicPHR-Timer
Timer for PHR reporting in TS 36.321 [6]. Value in number of sub-frames. Value sf10 corresponds to 10 subframes, sf20 corresponds to 20 subframes and so on.

prohibitPHR-Timer
Timer for PHR reporting in TS 36.321 [6]. Value in number of sub-frames. Value sf0 corresponds to 0 subframes, sf100 corresponds to 100 subframes and so on.

di-PathlossChange
DL Pathloss Change for PHR reporting in TS 36.321 [6]. Value in dB. Value dB1 corresponds to 1 dB, dB3 corresponds to 3 dB and so on.

sr-PathlossChange
UL Pathloss Change for SR transmission in TS 36.321 [6]. Value in dB. Value dB1 corresponds to 1 dB, dB3 corresponds to 3 dB and so on.

sr-ProhibitTimer
Timer for SR transmission on PUCCH in TS 36.321 [6]. Value in number of SR period(s). Value 0 means no timer for SR transmission on PUCCH is configured. Value 1 corresponds to one SR period, Value 2 corresponds to 2*SR periods and so on.

-- PDCP-Config

The IE PDCP-Config is used to set the configurable PDCP parameters for data radio bearers.

**PDCP-Config field descriptions**

**discardTimer**
Indicates the discard timer value specified in TS 36.323 [8]. Value in milliseconds. Value ms50 means 50 ms, ms100 means 100 ms and so on.

**statusReportRequired**
Indicates whether or not the UE shall send a PDCP Status Report upon re-establishment of the PDCP entity as specified in TS 36.323 [8].

**pdcp-SN-Size**
Indicates the PDCP Sequence Number length in bits. Value len7bits means that the 7-bit PDCP SN format is used and len12bits means that the 12-bit PDCP SN format is used, as specified in TS 36.323 [8].

**maxCID**
Indicates the value of the MAX_CID parameter as specified in TS 36.323 [8].

**profiles**
The profiles used by both compressor and decompressor in both UE and E-UTRAN. The field indicates which of the ROHC profiles specified in TS 36.323 [8] are supported, i.e. value ‘true’ indicates that the profile is supported. Profile 0x0000 shall always be supported when the use of ROHC is configured. If support of two ROHC profile identifiers with the same 8 LSB’s is signalled, only the profile corresponding to the highest value shall be applied.

**PDSCH-Config**

The IE **PDSCH-ConfigCommon** and the IE **PDSCH-ConfigDedicated** are used to specify the common and the UE specific PDSCH configuration respectively.
**PDSCH-Config information element**

```
-- ASN1START
PDSCH-ConfigCommon ::= SEQUENCE {
  referenceSignalPower  INTEGER (-60..50),
  p-b  INTEGER (0..3)
}
PDSCH-ConfigDedicated ::= SEQUENCE {
  p-a  ENUMERATED {
    dB-6, dB-4dot77, dB-3, dB-1dot77,
    dB0, dB1, dB2, dB3}
}
-- ASN1STOP

**PDSCH-Config field descriptions**

- **referenceSignalPower**
  Parameter: Reference-signal power, which provides the downlink reference-signal EPRE, see TS 36.213 [23, 5.2]. The actual value in dBm.

- **p-a**
  Parameter: $P_A$, see TS 36.213 [23, 5.2]. Value dB-6 corresponds to -6 dB, dB-4dot77 corresponds to -4.77 dB etc.

- **p-b**
  Parameter: $P_B$, see TS 36.213 [23, Table 5.2-1].

---

**PHICH-Config**

The IE **PHICH-Config** is used to specify the PHICH configuration.

**PHICH-Config information element**

```
-- ASN1START
PHICH-Config ::= SEQUENCE {
  phich-Duration  ENUMERATED {normal, extended},
  phich-Resource  ENUMERATED {oneSixth, half, one, two}
}
-- ASN1STOP

**PHICH-Config field descriptions**

- **phich-Duration**
  Parameter: Phich-Duration, see TS 36.211 [21, Table 6.9.3-1].

- **phich-Resource**
  Parameter: Ng, see TS 36.211 [21, 6.9]. Value oneSixth corresponds to 1/6, half corresponds to 1/2 and so on.

---

**PhysicalConfigDedicated**

The IE **PhysicalConfigDedicated** is used to specify the UE specific physical channel configuration.

**PhysicalConfigDedicated information element**

```
-- ASN1START
PhysicalConfigDedicated ::= SEQUENCE {
  pdsch-ConfigDedicated  PDSCCH-ConfigDedicated OPTIONAL, -- Need ON
  pucch-ConfigDedicated  PUCCH-ConfigDedicated OPTIONAL, -- Need ON
  pusch-ConfigDedicated  PUSCH-ConfigDedicated OPTIONAL, -- Need ON
  uplinkPowerControlDedicated  UplinkPowerControlDedicated OPTIONAL, -- Need ON
  tpc-PDSCCH-ConfigPUCCH  TPC-PDSCCH-Config OPTIONAL, -- Need ON
  tpc-PDSCCH-ConfigPUSCH  TPC-PDSCCH-Config OPTIONAL, -- Need ON
  cqi-ReportConfig  CQI-ReportConfig OPTIONAL, -- Need ON
  soundingRS-UL-ConfigDedicated  SoundingRS-UL-ConfigDedicated OPTIONAL, -- Need ON
  antennaInfo  CHOICE {
    explicitValue  AntennaInfoDedicated,
  }
}
-- ASN1STOP
NOTE: During handover, the UE performs a MAC reset, which involves reverting to the default CQI/ SRS/ SR configuration in accordance with subclause 5.3.13 and TS 36.321 [6, 5.9 & 5.2]. Hence, for these parts of the dedicated radio resource configuration, the default configuration (rather than the configuration used in the source cell) is used as the basis for the delta signalling that is included in the message used to perform handover.

—

**P-Max**

The IE **P-Max** is used to limit the UE’s uplink transmission power on a carrier frequency and is used to calculate the parameter \( P_{\text{compensation}} \) defined in TS 36.304 [4]. Corresponds to parameter \( P_{\text{EMAX_H}} \) in TS 36.101 [42]. The UE transmit power shall not exceed the configured maximum UE output power determined by this value as specified in TS 36.101 [42, 6.2.5].

---

**P-Max** information element

---

**PRACH-Config**

The IE **PRACH-ConfigSIB** and IE **PRACH-Config** are used to specify the PRACH configuration in the system information and in the mobility control information, respectively.

---

**PRACH-Config** information elements
### PRACH-Config field descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>rootSequenceIndex</code></td>
<td>Parameter: <code>RACH_ROOT_SEQUENCE</code>, see TS 36.211 [21, 5.7.1].</td>

<td>Parameter: <code>NCS</code> configuration, see TS 36.211, [21, 5.7.2: table 5.7.2-2] for preamble format 0..3 and TS 36.211, [21, 5.7.2: table 5.7.2-3] for preamble format 4.</td>
</tr>
<tr>
<td><code>prach-FreqOffset</code></td>
<td>Parameter: <code>prach-FrequencyOffset</code>, see TS 36.211, [21, 5.7.1]. For TDD the value range is dependent on the value of <code>prach-ConfigIndex</code>.</td>
</tr>
</tbody>
</table>

---

### PresenceAntennaPort1

The IE `PresenceAntennaPort1` is used to indicate whether all the neighbouring cells use Antenna Port 1. When set to `TRUE`, the UE may assume that at least two cell-specific antenna ports are used in all neighbouring cells.

#### PresenceAntennaPort1 information element

```asn1
PresenceAntennaPort1 ::= BOOLEAN
```

---

### PUCCH-Config

The IE `PUCCH-ConfigCommon` and IE `PUCCH-ConfigDedicated` are used to specify the common and the UE specific PUCCH configuration respectively.

#### PUCCH-Config information elements

```asn1
PUCCH-ConfigCommon ::= SEQUENCE {
    deltaPUCCH-Shift           ENUMERATED {ds1, ds2, ds3},
    nRB-CQI                    INTEGER (0..98),
    nCS-AN                     INTEGER (0..7),
    n1PUCCH-AN                 INTEGER (0..2047)
}
PUCCH-ConfigDedicated ::= SEQUENCE {
    ackNackRepetition          CHOICE{
        release               NULL,
        setup                 SEQUENCE {
            repetitionFactor     ENUMERATED {n2, n4, n6, spare1},
            n1PUCCH-AN-Rep       INTEGER (0..2047)
        };
    },
    tdd-AckNackFeedbackMode    ENUMERATED {bundling, multiplexing} OPTIONAL -- Cond TDD
}
```

-- ASN1STOP
**PUCCH-Config field descriptions**

**deltaPUCCH-Shift**
Parameter: \( \Delta^{PUCCH}_{\text{shift}} \), see 36.211, 5.4.1, where ds1 corresponds to value 1 ds2 to 2 etc.

**nRB-CQI**
Parameter: \( N_{RB}^{(2)} \), see TS 36.211 [21, 5.4].

**nCS-An**
Parameter: \( N_{cs}^{(1)} \) see TS 36.211 [21, 5.4].

**n1Pucch-AN**
Parameter: \( N_{PUCCH}^{(1)} \) see TS 36.213 [23, 10.1].

**ackNackRepetition**
Parameter indicates whether ACK/NACK repetition is configured, see TS 36.213 [23, 10.1].

**repetitionFactor**
Parameter \( N_{ANRep} \) see TS 36.213 [23, 10.1] where n2 corresponds to repetition factor 2, n4 to 4.

**n1Pucch-AN-Rep**
Parameter: \( N_{PUCCH,ANRep}^{(1)} \) see TS 36.213 [23, 10.1].

**tdd-AckNackFeedbackMode**
Parameter indicates one of the two TDD ACK/NACK feedback modes used, see TS 36.213 [23, 7.3], bundling corresponds to use of ACK/NACK bundling whereas, multiplexing corresponds to ACK/NACK multiplexing. The same value applies to both ACK/NACK feedback modes on PUCCH as well as on PUSCH. For TDD configuration 5, E-UTRAN should always set this field to bundling.

<table>
<thead>
<tr>
<th>Conditional presence</th>
<th>Explanation</th>

</tr>
</tbody>
</table>

**ul-ReferenceSignalsPUSCH**

Used to specify parameters needed for the transmission on PUSCH (or PUCCH).

**groupHoppingEnabled**

Parameter: Group-hopping-enabled, see TS 36.211 [21, 5.5.1.3].

**groupAssignmentPUSCH**

Parameter: $\Delta_{\text{SS}}$ See TS 36.211 [21, 5.5.1.3].

**sequenceHoppingEnabled**

Parameter: Sequence-hopping-enabled, see TS 36.211 [21, 5.5.1.4].

**cyclicShift**

Parameters: cyclicShift, see TS 36.211 [21, Table 5.5.2.1.1-2].

---

### RACH-ConfigCommon

The IE RACH-ConfigCommon is used to specify the generic random access parameters.

#### RACH-ConfigCommon information element

```asn1
RACH-ConfigCommon ::= SEQUENCE {

maxHARQ-Msg3Tx ::=
  INTEGER (1..8), ...
}

RACH-ConfigCommon field descriptions

numberOfRA-Preambles
Number of non-dedicated random access preambles in TS 36.321 [6]. Value is an integer. Value n4 corresponds to 4, n8 corresponds to 8 and so on.

preamblesGroupAConfig
Provides the configuration for preamble grouping in TS 36.321 [6]. If the field is not signalled, the size of the random access preambles group A [6] is equal to numberOfRA-Preambles.

sizeOfRA-PreamblesGroupA
Size of the random access preambles group A in TS 36.321 [6]. Value is an integer. Value n4 corresponds to 4, n8 corresponds to 8 and so on.

messageSizeGroupA
Threshold for preamble selection in TS 36.321 [6]. Value in bits. Value b56 corresponds to 56 bits, b144 corresponds to 144 bits and so on.

messagePowerOffsetGroupB
Threshold for preamble selection in TS 36.321 [6]. Value in dB. Value minusinfinity corresponds to –infinity. Value dB0 corresponds to 0 dB, dB5 corresponds to 5 dB and so on.

powerRampingStep
Power ramping factor in TS 36.321 [6]. Value in dB. Value dB0 corresponds to 0 dB, dB2 corresponds to 2 dB and so on.

preambleInitialReceivedTargetPower
Initial preamble power in TS 36.321 [6]. Value in dBm. Value dBm-120 corresponds to -120 dBm, dBm-118 corresponds to -118 dBm and so on.

preambleTransMax
Maximum number of preamble transmission in TS 36.321 [6]. Value is an integer. Value n3 corresponds to 3, n4 corresponds to 4 and so on.

ra-ResponseWindowSize
Duration of the RA response window in TS 36.321 [6]. Value in subframes. Value sf2 corresponds to 2 subframes, sf3 corresponds to 3 subframes and so on.

mac-ContentionResolutionTimer
Timer for contention resolution in TS 36.321 [6]. Value in subframes. Value sf8 corresponds to 8 subframes, sf16 corresponds to 16 subframes and so on.

maxHARQ-Msg3Tx
Maximum number of Msg3 HARQ transmissions in TS 36.321 [6], used for contention based random access. Value is an integer.

-- RACH-ConfigDedicated

The IE RACH-ConfigDedicated is used to specify the dedicated random access parameters.

RACH-ConfigDedicated information element

-- ASN1START
RACH-ConfigDedicated ::= SEQUENCE {
  ra-PreambleIndex INTEGER (0..63),
  ra-PRACH-MaskIndex INTEGER (0..15)
}

-- ASN1STOP

RACH-ConfigDedicated field descriptions

ra-PreambleIndex

ra-PRACH-MaskIndex
Explicitly signalled PRACH Mask Index for RA Resource selection in TS 36.321 [6].
RadioResourceConfigCommon

The IE \textit{RadioResourceConfigCommonSIB} and IE \textit{RadioResourceConfigCommon} are used to specify common radio resource configurations in the system information and in the mobility control information, respectively, e.g., the random access parameters and the static physical layer parameters.

RadioResourceConfigCommon information element

```asn1
-- ASN1START
RadioResourceConfigCommonSIB ::= SEQUENCE {
    rach-ConfigCommon     RACH-ConfigCommon,
    bch-Config           BCCH-Config,
    pcch-Config          PCCH-Config,
    prach-Config         PRACH-ConfigSIB,
    pdsch-ConfigCommon   PDSCH-ConfigCommon,
    pucch-ConfigCommon   PUCCH-ConfigCommon,
    soundingRS-UL-ConfigCommon SoundingRS-UL-ConfigCommon,
    ulCyclicPrefixLength UL-CyclicPrefixLength,
    ...                   
}

RadioResourceConfigCommon ::= SEQUENCE {

RadioResourceConfigCommon field descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p-Max</td>
<td>Pmax to be used in the target cell. If absent the UE applies the maximum power according to the UE capability.</td>
</tr>
<tr>
<td>modificationPeriodCoeff</td>
<td>Actual modification period, expressed in number of radio frames = modificationPeriodCoeff * defaultPagingCycle. n2 corresponds to value 2, n4 corresponds to value 4, n8 corresponds to value 8 and n16 corresponds to value 16.</td>
</tr>
<tr>
<td>defaultPagingCycle</td>
<td>Default paging cycle, used to derive ‘T’ in TS 36.304 [4]. Value rf32 corresponds to 32 radio frames, rf64 corresponds to 64 radio frames and so on.</td>
</tr>
<tr>
<td>nB</td>
<td>Parameter: nB is used as one of parameters to derive the Paging Frame and Paging Occasion according to TS 36.304 [4]. Value in multiples of defaultPagingCycle (‘T’). A value of T corresponds to value 1, 2T corresponds to value 2, and so on.</td>
</tr>
<tr>
<td>UL-CyclicPrefixLength</td>
<td>Parameter: Uplink cyclic prefix length see 36.211 [21, 5.2.1] where len1 corresponds to normal cyclic prefix and len2 corresponds to extended cyclic prefix.</td>
</tr>
</tbody>
</table>

Conditional presence

| TDD | The field is optional for TDD, Need ON; it is not present for FDD and the UE shall delete any existing value for this field. |

RadioResourceConfigDedicated

The IE RadioResourceConfigDedicated is used to setup/modify/release RBs, to modify the MAC main configuration, to modify the SPS configuration and to modify dedicated physical configuration.

## SchedulingRequestConfig

The IE SchedulingRequestConfig is used to specify the Scheduling Request related parameters.

### SchedulingRequestConfig information element

```asn1
SchedulingRequestConfig ::= CHOICE {
```
**SchedulingRequestConfig field descriptions**

**sr-PUCCH-ResourceIndex**
Parameter: $n_{PUCCH,SRI}^{(1)}$, see TS 36.213 [23, 10.1].

**sr-ConfigIndex**
Parameter $l_{sr}$. See TS 36.213 [23,10.1]. The values 156 and 157 are not applicable for Release 8.

**dsr-TransMax**
Parameter for SR transmission in TS 36.321 [6, 5.4.4]. The value n4 corresponds to 4 transmissions, n8 corresponds to 8 transmissions and so on.

---

**SoundingRS-UL-Config**

The IE SoundingRS-UL-Config is used to specify the uplink Sounding RS configuration.

**SoundingRS-UL-Config information element**

```plaintext
-- ASN1START

SoundingRS-UL-ConfigCommon ::= CHOICE {
  release NULL,
  setup SEQUENCE {
    srs-BandwidthConfig ENUMERATED {bw0, bw1, bw2, bw3, bw4, bw5, bw6, bw7},
    srs-SubframeConfig ENUMERATED {
      sc0, sc1, sc2, sc3, sc4, sc5, sc6, sc7,
      sc8, sc9, sc10, sc11, sc12, sc13, sc14, sc15},
    ackNackSRS-SimultaneousTransmission BOOLEAN,
    srs-MaxUpPts ENUMERATED {true} OPTIONAL -- Cond TDD
  }
}

SoundingRS-UL-ConfigDedicated ::= CHOICE{
  release NULL,
  setup SEQUENCE {
    srs-Bandwidth ENUMERATED {bw0, bw1, bw2, bw3},
    srs-HoppingBandwidth ENUMERATED {hbw0, hbw1, hbw2, hbw3},
    freqDomainPosition ENUMERATED {0..23},
    duration BOOLEAN,
    srs-ConfigIndex INTEGER {0..1023},
    transmissionComb INTEGER {0..1},
    cyclicShift ENUMERATED {cs0, cs1, cs2, cs3, cs4, cs5, cs6, cs7}
  }
}

-- ASN1STOP
```
### SoundingRS-UL-Config field descriptions

**srs-BandwidthConfig**  
Parameter: SRS Bandwidth Configuration. See TS 36.211, [1, table 5.5.3.2-1, 5.5.3.2-2, 5.5.3.2-3 and 5.5.3.2-4]. Actual configuration depends on UL bandwidth. bw0 corresponds to value 0, bw1 to value 1 and so on.

**srs-SubframeConfig**  
Parameter: SRS SubframeConfiguration. See TS 36.211, [1, table 5.5.3.3-1] applies for FDD whereas TS 36.211, [1, table 5.5.3.3-2] applies for TDD. sc0 corresponds to value 0, sc1 to value 1 and so on.

**ackNackSRS-SimultaneousTransmission**  
Parameter: Synchronous-AN-and-SRS, see TS 36.213 [23, 8.2].

**srs-Bandwidth**  
Parameter: $b_{\text{SRS}}$, see TS 36.211 [21, tables 5.5.3.2-1, 5.5.3.2-2, 5.5.3.2-3 and 5.5.3.2-4].

**freqDomainPosition**  
Parameter: $n_{\text{SRC}}$, see TS 36.211 [21, 5.5.3.2].

**srs-HoppingBandwidth**  
Parameter: SRS hopping bandwidth $b_{\text{hop}} \in \{0,1,2,3\}$, see TS 36.211 [21, 5.5.3.2] where hbw0 corresponds to value 0, hbw1 to value 1 and so on.

**duration**  
Parameter: Duration. See TS 36.213 [21, 8.2]. FALSE corresponds to “single” and value TRUE to “indefinite”.

**srs-ConfigIndex**  
Parameter: $i_{\text{SRS}}$. See TS 36.213 [23, table8.2-1].

**transmissionComb**  
Parameter: $k_{\text{TC}} \in \{0,1\}$, see TS 36.211 [21, 5.5.3.2].

**cyclicShift**  
Parameter: $n_{\text{SRS}}$. See TS 36.211 [21, 5.5.3.1], where cs0 corresponds to 0 etc.

**srs-MaxUpPts**  
Parameter: srsMaxUpPts, see TS 36.211 [21, 5.5.3.2]. If this field is present, reconfiguration of $n_{\text{SRS,0}}^{\text{max}}$ applies for UpPts, otherwise reconfiguration does not apply.

<table>

### SPS-Config

The IE SPS-Config is used to specify the semi-persistent scheduling configuration.

#### SPS-Config information element

```asn1
-- ASN1START

SPS-Config ::= SEQUENCE {
  semiPersistSchedC-RNTI   C-RNTI  OPTIONAL,  -- Need OR
  sps-ConfigDL            SPS-ConfigDL OPTIONAL,  -- Need ON
  sps-ConfigUL            SPS-ConfigUL OPTIONAL  -- Need ON
}

SPS-ConfigDL ::= CHOICE{
  release NULL,
  setup SEQUENCE {
    semiPersistSchedIntervalDL ENUMERATED {
      sf10, sf20, sf32, sf40, sf64, sf80,
      sf128, sf160, sf320, sf640, spare6, spare5, spare4, spare3, spare2, spare1},
    numberOfConfSPS-Processes INTEGER (1..8),
    n1-PUCCH-AN-PersistentList N1-PUCCH-AN-PersistentList,
    ...}
}

SPS-ConfigUL ::= CHOICE {
  release NULL,
  setup SEQUENCE {
    semiPersistSchedIntervalUL ENUMERATED {
```
sf10, sf20, sf32, sf40, sf64, sf80, sf128, sf160, sf320, sf640, spare6, spare5, spare4, spare3, spare2, spare1},
imPLICITReleaseAfter ENUMERATED {e2, e3, e4, e8},
p0-Persistent SEQUENCE {
p0-NominalPUSCH-Persistent INTEGER (-126..24),
p0-UE-PUSCH-Persistent INTEGER (-8..7)}
) OPTIONAL, -- Need OP
twoIntervalsConfig ENUMERATED {true} OPTIONAL, -- Cond TDD
... 
N1-PUCCH-AN-PersistentList ::= SEQUENCE (SIZE (1..4)) OF INTEGER (0..2047)
-- ASN1STOP

**SPS-Config field descriptions**

- **semiPersistSchedC-RNTI**
  Semi-persistent Scheduling C-RNTI, see TS 36.321 [6].

- **semiPersistSchedIntervalDL**
  Semi-persistent scheduling interval in downlink, see TS 36.321 [6]. Value in number of sub-frames. Value sf10 corresponds to 10 sub-frames, sf20 corresponds to 20 sub-frames and so on. For TDD, the UE shall round down the parameter to the nearest integer (of 10 sub-frames), e.g., sf10 corresponds to 10 sub-frames, sf32 corresponds to 30 sub-frames, sf128 corresponds to 120 sub-frames.

- **numberOfConfSPS-Processes**
  The number of configured HARQ processes for Semi-Persistent Scheduling, see TS 36.321 [6].

- **n1-PUCCH-AN-PersistentList**
  List of parameter: #PUCCH, see TS 36.213, [23, 10.1].

- **semiPersistSchedIntervalUL**
  Semi-persistent scheduling interval in uplink, see TS 36.321 [6]. Value in number of sub-frames. Value sf10 corresponds to 10 sub-frames, sf20 corresponds to 20 sub-frames and so on. For TDD, the UE shall round down the parameter to the nearest integer (of 10 sub-frames), e.g., sf10 corresponds to 10 sub-frames, sf32 corresponds to 30 sub-frames, sf128 corresponds to 120 sub-frames.

- **implicitReleaseAfter**
  Number of empty transmissions before implicit release, see TS 36.321 [6, 5.10.2]. Value e2 corresponds to 2 transmissions, e3 corresponds to 3 transmissions and so on.

- **p0-NominalPUSCH-Persistent**
  Parameter: \( R_{0, \text{NOMINAL, PUSCH}}(0) \). See TS 36.213 [23, 5.1.1.1], unit dBm step 1. This field is applicable for persistent scheduling, only. If choice ‘setup’ is used and \( p0\text{-Persistent} \) is absent, apply the value of \( p0\text{-NominalPUSCH} \) for \( p0\text{-NominalPUSCH-Persistent} \).

- **p0-UE-PUSCH-Persistent**
  Parameter: \( R_{0, \text{UE, PUSCH}}(0) \). See TS 36.213 [23, 5.1.1.1], unit dB. This field is applicable for persistent scheduling, only. If choice ‘setup’ is used and \( p0\text{-Persistent} \) is absent, apply the value of \( p0\text{-UE-PUSCH} \) for \( p0\text{-UE-PUSCH-Persistent} \).

- **twoIntervalsConfig**
  Trigger of two-intervals-Semi-Persistent Scheduling in uplink. See TS 36.321 [6, 5.10]. If this field is present, two-intervals-SPS is enabled for uplink. Otherwise, two-intervals-SPS is disabled.

<table>

```
ENUMERATED { 
    ssp0, ssp1, ssp2, ssp3, ssp4, ssp5, ssp6, ssp7, 
    ssp8 }
```

**TDD-Config field descriptions**

**subframeAssignment**
Indicates DL/UL subframe configuration where sa0 point to Configuration 0, sa1 to Configuration 1 etc. as specified in TS 36.211 [21, table 4.2.2].

**specialSubframePatterns**
Indicates Configuration as in TS 36.211 [21, table 4.2.1] where ssp0 point to Configuration 0, ssp1 to Configuration 1 etc.

---

**TimeAlignmentTimer**

The IE *TimeAlignmentTimer* is used to control how long the UE is considered uplink time aligned. Corresponds to the Timer for time alignment in TS 36.321 [6]. Value in number of sub-frames. Value sf500 corresponds to 500 sub-frames, sf750 corresponds to 750 sub-frames and so on.

**TimeAlignmentTimer information element**

```
-- ASN1START
TimeAlignmentTimer ::= ENUMERATED { 
    sf500, sf750, sf1280, sf1920, sf2560, sf5120, 
    sf10240, infinity }
-- ASN1STOP
```

---

**TPC-PDCCH-Config**

The IE *TPC-PDCCH-Config* is used to specify the RNTIs and indexes for PUCCH and PUSCH power control according to TS 36.212 [22]. The power control function can either be setup or released with the IE.

**TPC-PDCCH-Config information element**

```
-- ASN1START
TPC-PDCCH-Config ::= CHOICE { 
    release NULL, 
    setup SEQUENCE { 
        tpc-RNTI BIT STRING (SIZE (16)),
        tpc-Index TPC-Index
    } 
} 
TPC-Index ::= CHOICE { 
    indexOfFormat3 INTEGER (1..15),
    indexOfFormat3A INTEGER (1..31)
} 
-- ASN1STOP
```

---

**TPC-PDCCH-Config field descriptions**

**tpc-RNTI**
RNTI for power control using DCI format 3/3A, see TS 36.212 [22].

**tpc-Index**
Index of N or M, see TS 36.212 [22, 5.3.3.1.6 and 5.3.3.1.7], where N or M is dependent on the used DCI format (i.e. format 3 or 3a).

**indexOfFormat3**
Index of N when DCI format 3 is used. See TS 36.212 [22, 5.3.3.1.6].

**IndexOfFormat3A**
Index of M when DCI format 3A is used. See TS 36.212 [22, 5.3.3.1.7].
UplinkPowerControl

The IE UplinkPowerControlCommon and IE UplinkPowerControlDedicated are used to specify parameters for uplink power control in the system information and in the dedicated signalling, respectively.

UplinkPowerControl information elements

```
-- ASN1START

UplinkPowerControlCommon ::= SEQUENCE {
p0-NominalPUSCH INTEGER (-126..24),
alpha ENUMERATED {a10, a104, a105, a106, a107, a108, a109, a11},
p0-NominalPUCCH INTEGER (-127..-96),
deltaFList-PUCCH DeltaFList-PUCCH,
deltaPreambleMsg3 INTEGER (-1..6)
}

UplinkPowerControlDedicated ::= SEQUENCE {
p0-UE-PUSCH INTEGER (-8..7),
deltaMCS-Enabled ENUMERATED {en0, en1},
accumulationEnabled BOOLEAN,  
p0-UE-PUCCH INTEGER (-8..7),
pSRS-Offset INTEGER (0..15),
filterCoefficient FilterCoefficient DEFAULT fc4
}

DeltaFList-PUCCH ::= SEQUENCE {
deltaF-PUCCH-Format1 ENUMERATED {deltaF-2, deltaF0, deltaF2},
deltaF-PUCCH-Format1b ENUMERATED {deltaF1, deltaF3, deltaF5},
deltaF-PUCCH-Format2 ENUMERATED {deltaF-2, deltaF0, deltaF1, deltaF2},
deltaF-PUCCH-Format2a ENUMERATED {deltaF-2, deltaF0, deltaF2},
deltaF-PUCCH-Format2b ENUMERATED {deltaF-2, deltaF0, deltaF2}
}

-- ASN1STOP
```
### UplinkPowerControl field descriptions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>p0-NominalPUSCH</strong></td>
<td>Parameter: $P_{O_{\text{NominalPUSCH}}, \text{PUSCH}}$ See TS 36.213, 5.1.1.1, unit dBm. This field is applicable for non-persistent scheduling, only.</td>
</tr>
<tr>
<td><strong>alpha</strong></td>
<td>Parameter: $\alpha$ See TS 36.213, 5.1.1.1 where $a_0$ corresponds to 0, $a_{04}$ corresponds to value 0.4, $a_{05}$ to 0.5, $a_{06}$ to 0.6, $a_{07}$ to 0.7, $a_{08}$ to 0.8, $a_{09}$ to 0.9 and $a_{1}$ corresponds to 1.</td>
</tr>
<tr>
<td><strong>p0-NominalPUCCH</strong></td>
<td>Parameter: $P_{O_{\text{NominalPUCCH}}, \text{PUSCH}}$ See TS 36.213, 5.1.2.1, unit dBm.</td>
</tr>
<tr>
<td><strong>deltaF-PUCCH-FormatX</strong></td>
<td>Parameter: $\Delta_{F_{\text{PUCCH}}}(F)$ for the PUCCH formats 1, 1b, 2, 2a and 2b. See TS 36.213 [23, 5.1.2] where $\Delta_{F_{\text{PUCCH}}}=2$ corresponds to -2 dB, $\Delta_{F_{\text{PUCCH}}}=0$ corresponds to 0 dB and so on.</td>
</tr>
<tr>
<td><strong>p0-UE-PUSCH</strong></td>
<td>Parameter: $P_{O_{\text{UE-PUSCH}}}$ See TS 36.213 [23, 5.1.1.1], unit dB. This field is applicable for non-persistent scheduling, only.</td>
</tr>
<tr>
<td><strong>deltaPreambleMsg3</strong></td>
<td>Parameter: $\Delta_{\text{PREAMBLE, Msg3}}$ see TS 36.213 [23, 5.1.1.1]. Actual value = IE value $\times$ 2 [dB].</td>
</tr>
<tr>
<td><strong>deltaMCS-Enabled</strong></td>
<td>Parameter: $K_s$ See TS 36.213 [23, 5.1.1.1], $e_{n0}$ corresponds to value 0 corresponding to state “disabled”, $e_{n1}$ corresponds to value 1.25 corresponding to “enabled”.</td>
</tr>
<tr>
<td><strong>accumulationEnabled</strong></td>
<td>Parameter: Accumulation-enabled, see TS 36.213 [23, 5.1.1.1]. TRUE corresponds to “enabled” whereas FALSE corresponds to “disabled”.</td>
</tr>
<tr>
<td><strong>p0-UE-PUCCH</strong></td>
<td>Parameter: $P_{O_{\text{UE-PUCCH}}}$ See TS 36.213 [23, 5.1.2.1]. Unit dB</td>
</tr>
<tr>
<td><strong>pSRS-Offset</strong></td>
<td>Parameter: $P_{\text{SRS, Offset}}$ See TS 36.213 [23, 5.1.3.1]. For $K_s=1.25$, the actual parameter value is $p_{\text{SRS-Offset}}$ value $-3$. For $K_s=0$, the actual parameter value is $-10.5 + 1.5 \times p_{\text{SRS-Offset}}$ value.</td>
</tr>
<tr>
<td><strong>filterCoefficient</strong></td>
<td>Specifies the filtering coefficient for RSRP measurements used to calculate path loss, as specified in TS 36.213 [23, 5.1.1.1]. The same filtering mechanism applies as for quantityConfig described in 5.5.3.2.</td>
</tr>
</tbody>
</table>

#### 6.3.3 Security control information elements

- **NextHopChainingCount**

The IE `NextHopChainingCount` is used to update the $K_{\text{NB}}$ key and corresponds to parameter NCC: See TS 33.401 [32, 7.2.8.4].

```asn1
NextHopChainingCount ::= INTEGER (0..7)
```

- **SecurityAlgorithmConfig**

The IE `SecurityAlgorithmConfig` is used to configure AS integrity protection algorithm (SRBs) and AS ciphering algorithm (SRBs and DRBs).

```asn1
SecurityAlgorithmConfig ::= SEQUENCE {
    cipheringAlgorithm ENUMERATED {
        eea0, eea1, eea2, spare5, spare4, spare3,
    }
}```
Release 9

integrityProtAlgorithm

| ENUMERATED { |
| eia0-v920, eia1, eia2, spare5, spare4, spare3, |
| spare2, spare1, ...} |

-- ASN1STOP

| SecurityAlgorithmConfig field descriptions |
| **integrityProtAlgorithm** |
| Indicates the integrity protection algorithm to be used for SRBs, as specified in TS 33.401 [32, 5.1.4.2]. |
| **cipheringAlgorithm** |
| Indicates the ciphering algorithm to be used for SRBs and DRBs, as specified in TS 33.401 [32, 5.1.3.2]. |

--- ShortMAC-I ---

The IE **ShortMAC-I** is used to identify and verify the UE at RRC connection re-establishment. The 16 least significant bits of the MAC-I calculated using the security configuration of the source cell, as specified in 5.3.7.4.

**ShortMAC-I information element**

```plaintext
-- ASN1START
ShortMAC-I ::= BIT STRING (SIZE (16))
-- ASN1STOP
```

--- Mobility control information elements ---

--- AdditionalSpectrumEmission ---

The UE requirements related to IE **AdditionalSpectrumEmission** are defined in TS 36.101 [42, table 6.2.4-1].

**AdditionalSpectrumEmission information element**

```plaintext
-- ASN1START
AdditionalSpectrumEmission ::= INTEGER (1..32)
-- ASN1STOP
```

--- ARFCN-ValueCDMA2000 ---

The IE **ARFCN-ValueCDMA2000** used to indicate the CDMA2000 carrier frequency within a CDMA2000 band, see C.S0002-A [12].

**ARFCN-ValueCDMA2000 information element**

```plaintext
-- ASN1START
ARFCN-ValueCDMA2000 ::= INTEGER (0..2047)
-- ASN1STOP
```

--- ARFCN-ValueEUTRA ---

The IE **ARFCN-ValueEUTRA** is used to indicate the ARFCN applicable for a downlink, uplink or bi-directional (TDD) E-UTRA carrier frequency, as defined in TS 36.101 [42].

**ARFCN-ValueEUTRA information element**

```plaintext
-- ASN1START
```
ARFCN-ValueEUTRA ::= INTEGER (0..maxEARFCN)
-- ASN1STOP

-- ARFCN-ValueGERAN
The IE ARFCN-ValueGERAN is used to specify the ARFCN value applicable for a GERAN BCCH carrier frequency, see TS 45.005 [20].

ARFCN-ValueGERAN information element

-- ASN1START
ARFCN-ValueGERAN ::= INTEGER (0..1023)
-- ASN1STOP

-- ARFCN-ValueUTRA
The IE ARFCN-ValueUTRA is used to indicate the ARFCN applicable for a downlink (Nd, FDD) or bi-directional (Nt, TDD) UTRA carrier frequency, as defined in TS 25.331 [19].

ARFCN-ValueUTRA information element

-- ASN1START
ARFCN-ValueUTRA ::= INTEGER (0..16383)
-- ASN1STOP

-- BandclassCDMA2000
The IE BandclassCDMA2000 is used to define the CDMA2000 band in which the CDMA2000 carrier frequency can be found, as defined in C.S0057-B [24, table 1.5.1].

BandclassCDMA2000 information element

-- ASN1START
BandclassCDMA2000 ::= ENUMERATED {bc0, bc1, bc2, bc3, bc4, bc5, bc6, bc7, bc8, bc9, bc10, bc11, bc12, bc13, bc14, bc15, bc16, bc17, spare14, spare13, spare12, spare11, spare10, spare9, spare8, spare7, spare6, spare5, spare4, spare3, spare2, spare1, ...}
-- ASN1STOP

-- BandIndicatorGERAN
The IE BandIndicatorGERAN indicates how to interpret an associated GERAN carrier ARFCN, see TS 45.005 [20]. More specifically, the IE indicates the GERAN frequency band in case the ARFCN value can concern either a DCS 1800 or a PCS 1900 carrier frequency. For ARFCN values not associated with one of these bands, the indicator has no meaning.

BandIndicatorGERAN information element

-- ASN1START
BandIndicatorGERAN ::= ENUMERATED {dcs1800, pcs1900}
-- ASN1STOP
– **CarrierFreqCDMA2000**

The IE `CarrierFreqCDMA2000` used to provide the CDMA2000 carrier information.

**CarrierFreqCDMA2000 information element**

```asn1
CarrierFreqCDMA2000 ::= SEQUENCE {
  bandClass     BandclassCDMA2000,
  arfcn         ARFCN-ValueCDMA2000
}
```

– **CarrierFreqGERAN**

The IE `CarrierFreqGERAN` is used to provide an unambiguous carrier frequency description of a GERAN cell.

**CarrierFreqGERAN information element**

```asn1
CarrierFreqGERAN ::= SEQUENCE {
  arfcn         ARFCN-ValueGERAN,
  bandIndicator BandIndicatorGERAN
}
```

**CarrierFreqGERAN field descriptions**

- `arfcn`  
  GERAN ARFCN of BCCH carrier.
- `bandIndicator`  
  Indicates how to interpret the ARFCN of the BCCH carrier.

– **CarrierFreqsGERAN**

The IE `CarrierFreqListGERAN` is used to provide one or more GERAN ARFCN values, as defined in TS 44.005 [43], which represents a list of GERAN BCCH carrier frequencies.

**CarrierFreqsGERAN information element**

```asn1
CarrierFreqsGERAN ::= SEQUENCE {
  startingARFCN               ARFCN-ValueGERAN,
  bandIndicator               BandIndicatorGERAN,
  followingARFCNs            CHOICE {
    explicitListOfARFCNs       ExplicitListOfARFCNs,
    equallySpacedARFCNs        SEQUENCE {
      arfcnSpacing              INTEGER (1..8),
      numberOfFollowingARFCNs  INTEGER (0..31)
    },
    variableBitMapOfARFCNs     OCTET STRING (SIZE (1..16))
  }
}
ExplicitListofARFCNs ::= SEQUENCE (SIZE (0..31)) OF ARFCN-ValueGERAN
```

-- ASN1STOP
**CarrierFreqsGERAN field descriptions**

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>startingARFCN</td>
<td>The first ARFCN value, s, in the set.</td>
</tr>
<tr>
<td>bandIndicator</td>
<td>Indicates how to interpret the ARFCN of the BCCH carrier.</td>
</tr>
<tr>
<td>followingARFCNs</td>
<td>Field containing a representation of the remaining ARFCN values in the set.</td>
</tr>
<tr>
<td>explicitListOfARFCNs</td>
<td>The remaining ARFCN values in the set are explicitly listed one by one.</td>
</tr>
<tr>
<td>arfcnSpacing</td>
<td>Space, d, between a set of equally spaced ARFCN values.</td>
</tr>
<tr>
<td>numberOfFollowingARFCNs</td>
<td>The number, n, of the remaining equally spaced ARFCN values in the set. The complete set of (n+1) ARFCN values is defined as: {s, (s + d) mod 1024, ((s + 2<em>d) mod 1024) ... ((s + n</em>d) mod 1024)}.</td>
</tr>
<tr>
<td>variableBitmapOfARFCNs</td>
<td>Bitmap field representing the remaining ARFCN values in the set. The leading bit of the first octet in the bitmap corresponds to the ARFCN = ((s + 1) mod 1024), the next bit to the ARFCN = ((s + 2) mod 1024), and so on. If the bitmap consist of N octets, the trailing bit of octet N corresponds to ARFCN = ((s + 8*N) mod 1024). The complete set of ARFCN values consists of ARFCN = s and the ARFCN values, where the corresponding bit in the bitmap is set to &quot;1&quot;.</td>
</tr>
</tbody>
</table>

---

**CDMA2000-Type**

The IE **CDMA2000-Type** is used to describe the type of CDMA2000 network.

**CDMA2000-Type information element**

```asn1
CDMA2000-Type ::= ENUMERATED {type1XRTT, typeHRPD}
```

---

**CellIdentity**

The IE **CellIdentity** is used to unambiguously identify a cell within a PLMN.

**CellIdentity information element**

```asn1
CellIdentity ::= BIT STRING (SIZE (28))
```

---

**CellIndexList**

The IE **CellIndexList** concerns a list of cell indices, which may be used for different purposes.

**CellIndexList information element**

```asn1
CellIndexList ::= SEQUENCE (SIZE (1..maxCellMeas)) OF CellIndex
CellIndex ::= INTEGER (1..maxCellMeas)
```

---
CellReselectionPriority

The IE **CellReselectionPriority** concerns the absolute priority of the concerned carrier frequency/set of frequencies (GERAN)/bandclass (CDMA2000), as used by the cell reselection procedure. Corresponds with parameter “priority” in TS 36.304 [4]. Value 0 means: lowest priority. The UE behaviour for the case the field is absent, if applicable, is specified in TS 36.304 [4].

**CellReselectionPriority** information element

```asn1
CellReselectionPriority ::= INTEGER (0..7)
```

CSFB-RegistrationParam1XRTT

The IE **CSFB-RegistrationParam1XRTT** is used to indicate whether or not the UE shall perform a CDMA2000 1xRTT pre-registration if the UE does not have a valid/current pre-registration.

```asn1
CSFB-RegistrationParam1XRTT ::= SEQUENCE {
  sid             BIT STRING (SIZE (15)),
  nid             BIT STRING (SIZE (16)),
  multipleSID     BOOLEAN,
  multipleNID     BOOLEAN,
  homeReg         BOOLEAN,
  foreignSIDReg   BOOLEAN,
  foreignNIDReg   BOOLEAN,
  parameterReg    BOOLEAN,
  powerUpReg      BOOLEAN,
  registrationPeriod     BIT STRING (SIZE (7)),
  registrationZone     BIT STRING (SIZE (12)),
  totalZone         BIT STRING (SIZE (3)),
  zoneTimer         BIT STRING (SIZE (3))
}

CSFB-RegistrationParam1XRTT-v920 ::= SEQUENCE {
  powerDownReg-r9  ENUMERATED {true}
}
```
CSFB-RegistrationParam1XRTT field descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>

<tr>
<td>foreignNIDReg</td>
<td>The CDMA2000 1xRTT NID roamer registration indicator.</td>
</tr>
<tr>
<td>parameterReg</td>
<td>The CDMA2000 1xRTT Parameter-change registration indicator.</td>
</tr>
<tr>
<td>powerUpReg</td>
<td>The CDMA2000 1xRTT Power-up registration indicator.</td>
</tr>
<tr>
<td>registrationPeriod</td>
<td>The CDMA2000 1xRTT Registration period.</td>
</tr>
<tr>
<td>registrationZone</td>
<td>The CDMA2000 1xRTT Registration zone.</td>
</tr>
<tr>
<td>totalZone</td>
<td>The CDMA2000 1xRTT Number of registration zones to be retained.</td>
</tr>
<tr>
<td>zoneTimer</td>
<td>The CDMA2000 1xRTT Zone timer length.</td>
</tr>
<tr>
<td>powerDownReg</td>
<td>The CDMA2000 1xRTT Power-down registration indicator. If set to TRUE, the UE that has a valid / current CDMA2000 1xRTT pre-registration will perform a CDMA2000 1xRTT power down registration when it is switched off.</td>
</tr>
</tbody>
</table>

CellGlobalIdEUTRA

The IE CellGlobalIdEUTRA specifies the Evolved Cell Global Identifier (ECGI), the globally unique identity of a cell in E-UTRA.

CellGlobalIdEUTRA information element

```
-- ASN1START
CellGlobalIdEUTRA ::= SEQUENCE {
  plmn-identity PLMN-Identity,
  cellIdentity CellIdentity
}
-- ASN1STOP
```

CellGlobalIdEUTRA field descriptions

<table>

</table>

– MobilityParametersCDMA2000 (1xRTT)

The MobilityParametersCDMA2000 contains the parameters provided to the UE for handover and (enhanced) CSFB to 1xRTT support, as defined in C.S0087 [44].

MobilityParametersCDMA2000 information element

```asn1
MobilityParametersCDMA2000 ::= OCTET STRING
```

– MobilityStateParameters

The IE MobilityStateParameters contains parameters to determine UE mobility state.

MobilityStateParameters information element

```asn1
MobilityStateParameters ::= SEQUENCE {  
  t-Evaluation       ENUMERATED {  
    s30, s60, s120, s180, s240, spare3, spare2, spare1  
  },  
  t-HystNormal       ENUMERATED {  
    s30, s60, s120, s180, s240, spare3, spare2, spare1  
  },  
  n-CellChangeMedium INTEGER (1..16),  
  n-CellChangeHigh   INTEGER (1..16)  
}
```

-- ASN1STOP
**MobilityStateParameters field descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>t-Evaluation</td>
<td>The duration for evaluating criteria to enter mobility states. Corresponds to $T_{CRmax}$ in TS 36.304 [4]. Value in seconds, $s_{30}$ corresponds to 30 s and so on.</td>
</tr>
<tr>
<td>t-HystNormal</td>
<td>The additional duration for evaluating criteria to enter normal mobility state. Corresponds to $T_{CRmaxHyst}$ in TS 36.304 [4]. Value in seconds, $s_{30}$ corresponds to 30 s and so on.</td>
</tr>
<tr>
<td>n-CellChangeMedium</td>
<td>The number of cell changes to enter medium mobility state. Corresponds to $N_{CR,M}$ in TS 36.304 [4].</td>
</tr>
<tr>
<td>n-CellChangeHigh</td>
<td>The number of cell changes to enter high mobility state. Corresponds to $N_{CR,H}$ in TS 36.304 [4].</td>

</tbody>
</table>

---

**PhysCellId**

The IE *PhysCellId* is used to indicate the physical layer identity of the cell, as defined in TS 36.211 [21].

**PhysCellId information element**

```
-- ASN1START
PhysCellId ::= INTEGER (0..503)
-- ASN1STOP
```

---

**PhysCellIdRange**

The IE *PhysCellIdRange* is used to encode either a single or a range of physical cell identities. The range is encoded by using a *start* value and by indicating the number of consecutive physical cell identities (including *start*) in the range.

**PhysCellIdRange information element**

```
-- ASN1START
PhysCellIdRange ::= SEQUENCE {
    start  PhysCellId,  
    range  ENUMERATED { n4, n8, n12, n16, n24, n32, n48, n64, n84, 
                        n96, n128, n168, n252, n504, spare2, 
                        spare1 } OPTIONAL  -- Need OP
}
-- ASN1STOP
```

**PhysCellIdRange field descriptions**

<table>
<thead>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start</td>
<td>Indicates the lowest physical cell identity in the range.</td>
</tr>
<tr>
<td>range</td>
<td>Indicates the number of physical cell identities in the range (including <em>start</em>). Value n4 corresponds with 4, n8 corresponds with 8 and so on. The UE shall apply value 1 in case the field is absent, in which case only the physical cell identity value indicated by <em>start</em> applies.</td>
</tr>
</tbody>
</table>

---

**PhysCellIdRangeUTRA-FDDList**

The IE *PhysCellIdRangeUTRA-FDDList* is used to encode one or more of *PhysCellIdRangeUTRA-FDD*. While the IE *PhysCellIdRangeUTRA-FDD* is used to encode either a single physical layer identity or a range of physical layer identities, i.e. primary scrambling codes. Each range is encoded by using a *start* value and by indicating the number of consecutive physical cell identities (including *start*) in the range.

**PhysCellIdRangeUTRA-FDDList information element**

```
-- ASN1START
```
PhysCellIdRangeUTRA-FDDList field descriptions

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

- **PhysCellIdCDMA2000**

The IE `PhysCellIdCDMA2000` identifies the PNOffset that represents the "Physical cell identity" in CDMA2000.

**PhysCellIdCDMA2000 information element**

```asn1
PhysCellIdCDMA2000 ::= INTEGER (0..maxPNOffset)
```

- **PhysCellIdGERAN**

The IE `PhysCellIdGERAN` contains the Base Station Identity Code (BSIC).

**PhysCellIdGERAN information element**

```asn1
PhysCellIdGERAN ::= SEQUENCE {
    networkColourCode       BIT STRING (SIZE (3)),
    baseStationColourCode   BIT STRING (SIZE (3))
}
```

**PhysCellIdGERAN field descriptions**

<table>
<thead>
<tr>

<td>Base station Colour Code as defined in TS 23.003 [27].</td>
</tr>
</tbody>
</table>

- **PhysCellIdUTRA-FDD**

The IE `PhysCellIdUTRA-FDD` is used to indicate the physical layer identity of the cell, i.e. the primary scrambling code, as defined in TS 25.331 [19].

**PhysCellIdUTRA-FDD information element**

```asn1
PhysCellIdUTRA-FDD ::= INTEGER (0..511)
```
PhysCellIdUTRA-TDD

The IE *PhysCellIdUTRA-TDD* is used to indicate the physical layer identity of the cell, i.e. the cell parameters ID (TDD), as specified in TS 25.331 [19]. Also corresponds to the Initial Cell Parameter Assignment in TS 25.223 [46].

**PhysCellIdUTRA-TDD** information element

```
-- ASN1START
PhysCellIdUTRA-TDD ::= INTEGER (0..127)
-- ASN1STOP
```

**PLMN-Identity**

The IE *PLMN-Identity* identifies a Public Land Mobile Network. Further information regarding how to set the IE are specified in TS 23.003 [27].

**PLMN-Identity** information element

```
-- ASN1START
PLMN-Identity ::= SEQUENCE {
  mcc            MCC OPTIONAL, -- Cond MCC
  mnc            MNC
}
MCC ::= SEQUENCE (SIZE (3)) OF MCC-MNC-Digit
MNC ::= SEQUENCE (SIZE (2..3)) OF MCC-MNC-Digit
MCC-MNC-Digit ::= INTEGER (0..9)
-- ASN1STOP
```

**PLMN-Identity** field descriptions

- **mcc**
  - The first element contains the first MCC digit, the second element the second MCC digit and so on. If the field is absent, it takes the same value as the mcc of the immediately preceding IE *PLMN-Identity*. See TS 23.003 [27].
- **mnc**
  - The first element contains the first MNC digit, the second element the second MNC digit and so on. See TS 23.003 [27].

<table>

</thead>
<tbody>
<tr>
<td>PreRegAllowed</td>
<td>The field is mandatory in case the preRegistrationAllowed is set to 'true'. Otherwise the field is not present and the UE shall delete any existing value for this field.</td>
</tr>
</tbody>
</table>

– **Q-QualMin**

The IE \(Q\)-\(\text{QualMin}\) is used to indicate for cell selection/ re-selection the required minimum received RSRQ level in the (E-UTRA) cell. Corresponds to parameter \(Q_{\text{qualmin}}\) in 36.304 [4]. Actual value \(Q_{\text{qualmin}}\) = IE value [dB].

**Q-QualMin information element**

```
-- ASN1START
Q-QualMin-r9 ::= INTEGER (-34..-3)
-- ASN1STOP
```

– **Q-RxLevMin**

The IE \(Q\)-\(\text{RxLevMin}\) is used to indicate for cell selection/ re-selection the required minimum received RSRP level in the (E-UTRA) cell. Corresponds to parameter \(Q_{\text{rxlevmin}}\) in 36.304 [4]. Actual value \(Q_{\text{rxlevmin}}\) = IE value * 2 [dBm].

**Q-RxLevMin information element**

```
-- ASN1START
Q-RxLevMin ::= INTEGER (-70..-22)
-- ASN1STOP
```

– **Q-OffsetRange**

The IE \(Q\)-\(\text{OffsetRange}\) is used to indicate a cell or frequency specific offset to be applied when evaluating candidates for cell re-selection or when evaluating triggering conditions for measurement reporting. The value in dB. Value dB-24 corresponds to -24 dB, dB-22 corresponds to -22 dB and so on.

**Q-OffsetRange information element**

```
-- ASN1START
Q-OffsetRange ::= ENUMERATED {
  dB-24, dB-22, dB-20, dB-18, dB-16, dB-14,
  dB-12, dB-10, dB-8, dB-6, dB-5, dB-4, dB-3,
  dB-2, dB-1, dB0, dB1, dB2, dB3, dB4, dB5,
  dB6, dB8, dB10, dB12, dB14, dB16, dB18,
  dB20, dB22, dB24}
-- ASN1STOP
```
– **Q-OffsetRangeInterRAT**

The IE *Q-OffsetRangeInterRAT* is used to indicate a frequency specific offset to be applied when evaluating triggering conditions for measurement reporting. The value in dB.

**Q-OffsetRangeInterRAT information element**

```asnc
Q-OffsetRangeInterRAT ::= INTEGER (-15..15)
```

– **ReselectionThreshold**

The IE *ReselectionThreshold* is used to indicate an Rx level threshold for cell reselection. Actual value of threshold = IE value * 2 [dB].

**ReselectionThreshold information element**

```asnc
ReselectionThreshold ::= INTEGER (0..31)
```

– **ReselectionThresholdQ**

The IE *ReselectionThresholdQ* is used to indicate a quality level threshold for cell reselection. Actual value of threshold = IE value [dB].

**ReselectionThresholdQ information element**

```asnc
ReselectionThresholdQ-r9 ::= INTEGER (0..31)
```

– **SpeedStateScaleFactors**

The IE *SpeedStateScaleFactors* concerns factors, to be applied when the UE is in medium or high speed state, used for scaling a mobility control related parameter.

**SpeedStateScaleFactors information element**

```asnc
SpeedStateScaleFactors ::= SEQUENCE {
    sf-Medium  ENUMERATED {oDot25, oDot5, oDot75, lDot0},
    sf-High    ENUMERATED {oDot25, oDot5, oDot75, lDot0}
}
```
SpeedStateScaleFactors field descriptions

**sf-Medium**
The concerned mobility control related parameter is multiplied with this factor if the UE is in Medium Mobility state as defined in TS 36.304 [4]. Value oDot25 corresponds to 0.25, oDot5 corresponds to 0.5 , oDot75 corresponds to 0.75 and so on.

**sf-High**
The concerned mobility control related parameter is multiplied with this factor if the UE is in High Mobility state as defined in TS 36.304 [4]. Value oDot25 corresponds to 0.25, oDot5 corresponds to 0.5 , oDot75 corresponds to 0.75 and so on.

### SystemInfoListGERAN

The IE SystemInfoListGERAN contains system information of a GERAN cell.

**SystemInfoListGERAN information element**

```
-- ASN1START
SystemInfoListGERAN ::= SEQUENCE (SIZE (1..maxGERAN-SI)) OF
  OCTET STRING (SIZE (1..23))
-- ASN1STOP
```

**SystemInfoListGERAN field descriptions**

Each OCTET STRING contains one complete System Information (SI) message as defined in TS 44.018 [45, table 9.1.1] or a complete Packet System Information (PSI) message as defined in TS 44.060 [36, table 11.2.1].

### SystemTimeInfoCDMA2000

The IE SystemTimeInfoCDMA2000 informs the UE about the absolute time in the current cell. The UE uses this absolute time knowledge to derive the CDMA2000 Physical cell identity, expressed as PNOffset, of neighbour CDMA2000 cells.

**NOTE:** The UE needs the CDMA2000 system time with a certain level of accuracy for performing measurements as well as for communicating with the CDMA2000 network (HRPD or 1xRTT).

**SystemTimeInfoCDMA2000 information element**

```
-- ASN1START
SystemTimeInfoCDMA2000 ::= SEQUENCE {
  cdma-EUTRA-Synchronisation BOOLEAN,
  cdma-SystemTime CHOICE {
    synchronousSystemTime BIT STRING (SIZE (39)),
    asynchronousSystemTime BIT STRING (SIZE (49))
  }
}
-- ASN1STOP
```
SystemTimeInfoCDMA2000 field descriptions

</tr>
</tbody>
</table>

---

**TrackingAreaCode**

The IE TrackingAreaCode is used to identify a tracking area within the scope of a PLMN, see TS 24.301 [35].

```asn1
TrackingAreaCode ::= BIT STRING (SIZE (16))
```

---

**T-Reselection**

The IE T-Reselection concerns the cell reselection timer TreselectionRAT for E-UTRA, UTRA, GERAN or CDMA2000. Value in seconds.

```asn1
T-Reselection ::= INTEGER (0..7)
```

---

### 6.3.5 Measurement information elements

**AllowedMeasBandwidth**

The IE AllowedMeasBandwidth is used to indicate the maximum allowed measurement bandwidth on a carrier frequency as defined by the parameter Transmission Bandwidth Configuration “NRB” TS 36.104 [47]. The values mbw6, mbw15, mbw25, mbw50, mbw75, mbw100 indicate 6, 15, 25, 50, 75 and 100 resource blocks respectively.

```asn1
AllowedMeasBandwidth ::= ENUMERATED {mbw6, mbw15, mbw25, mbw50, mbw75, mbw100}
```

**Hysteresis**

The IE Hysteresis is a parameter used within the entry and leave condition of an event triggered reporting condition. The actual value is IE value * 0.5 dB.
Hysteresis information element

Hysteresis ::= INTEGER (0..30)

MeasConfig

The IE MeasConfig specifies measurements to be performed by the UE, and covers intra-frequency, inter-frequency and inter-RAT mobility as well as configuration of measurement gaps.

MeasConfig information element

MeasConfig ::= SEQUENCE {
  -- Measurement objects
  measObjectToRemoveList             MeasObjectTo RemoveList OPTIONAL, -- Need ON
  measObjectToAddModList             MeasObjectToAddModList OPTIONAL, -- Need ON
  -- Reporting configurations

  reportConfigToAddModList           ReportConfigToAddModList OPTIONAL, -- Need ON
  -- Measurement identities
  measIdToRemoveList                 MeasIdToRemoveList OPTIONAL, -- Need ON
  measIdToAddModList                 MeasIdToAddModList OPTIONAL, -- Need ON
  -- Other parameters
  quantityConfig                      QuantityConfig OPTIONAL, -- Need ON
  measGapConfig                       MeasGapConfig OPTIONAL, -- Need ON
  s-Measure                           RSRP-Range OPTIONAL, -- Need ON
  preRegistrationInfoHRPD            PreRegistrationInfoHRPD OPTIONAL, -- Need OP
  speedStatePars                      CHOICE {
    release                            NULL,
    setup                              SEQUENCE {
      mobilityStateParameters          MobilityStateParameters,
      timeToTrigger-SF                 SpeedStateScaleFactors
    }
  }
  ...
}

MeasIdToRemoveList ::= SEQUENCE (SIZE (1..maxMeasId)) OF MeasId
MeasObjectTo RemoveList ::= SEQUENCE (SIZE (1..maxObjectId)) OF MeasObjectId
ReportConfigTo RemoveList ::= SEQUENCE (SIZE (1..maxReportConfigId)) OF ReportConfigId

-- ASN1STOP
MeasConfig field descriptions

measObjectToRemoveList
List of measurement objects to remove.

measObjectId
Used to identify a measurement object configuration.

measObject
Specifies measurement object configurations for E-UTRA, UTRA, GERAN, or CDMA2000 measurements.

reportConfigToRemoveList
List of measurement reporting configurations to remove.

reportConfigId
Used to identify a measurement reporting configuration.

reportConfig
Specifies measurement reporting configurations for E-UTRA, UTRA, GERAN, or CDMA2000 measurements.

measIdToRemoveList
List of measurement identities to remove.

measGapConfig
Used to setup and release measurement gaps.

s-Measure
Serving cell quality threshold controlling whether or not the UE is required to perform measurements of intra-frequency, inter-frequency and inter-RAT neighbouring cells. Value “0” indicates to disable s-Measure.

PreRegistrationInfoHRPD
The CDMA2000 HRPD Pre-Registration Information tells the UE if it should pre-register with the CDMA2000 HRPD network and identifies the Pre-registration zone to the UE.

timeToTrigger-SF
The timeToTrigger in ReportConfigEUTRA and in ReportConfigInterRAT are multiplied with the scaling factor applicable for the UE’s speed state.

MeasGapConfig
The IE MeasGapConfig specifies the measurement gap configuration and controls setup/release of measurement gaps.

MeasGapConfig information element

MeasGapConfig ::= CHOICE {
  release NULL,
  setup SEQUENCE {
    gapOffset CHOICE {
      gp0 INTEGER (0..39),
      gp1 INTEGER (0..79),
      ...
    }
  }
}

MeasGapConfig field descriptions

gapOffset
Value gapOffset of gp0 corresponds to gap offset of Gap Pattern Id “0” with MGRP = 40ms, gapOffset of gp1 corresponds to gap offset of Gap Pattern Id “1” with MGRP = 80ms. Also used to specify the measurement gap pattern to be applied, as defined in TS 36.133 [16].

MeasId
The IE MeasId is used to identify a measurement configuration, i.e., linking of a measurement object and a reporting configuration.

MeasId information element

MeasId ::= INTEGER (1..maxMeasId)
MeasIdToAddModList

The IE MeasIdToAddModList concerns a list of measurement identities to add or modify, with for each entry the measId, the associated measObjectId and the associated reportConfigId.

MeasIdToAddModList information element

MeasIdToAddModList ::= SEQUENCE (SIZE (1..maxMeasId)) OF MeasIdToAddMod

MeasIdToAddMod ::= SEQUENCE {
  measId MeasId,
  measObjectId MeasObjectId,
  reportConfigId ReportConfigId
}

MeasObjectCDMA2000

The IE MeasObjectCDMA2000 specifies information applicable for inter-RAT CDMA2000 neighbouring cells.

MeasObjectCDMA2000 information element

MeasObjectCDMA2000 ::= SEQUENCE {
  cdma2000-Type CDMA2000-Type,
  carrierFreq CarrierFreqCDMA2000,
  searchWindowSize INTEGER (0..15) OPTIONAL, -- Need ON
  offsetFreq Q-OffsetRangeInterRAT DEFAULT 0,
  cellsToRemoveList CellIndexList OPTIONAL, -- Need ON
  cellsToAddModList CellsToAddModListCDMA2000 OPTIONAL, -- Need ON
  cellForWhichToReportCGI PhysCellIdCDMA2000 OPTIONAL, -- Need ON
  ...
}

CellsToAddModListCDMA2000 ::= SEQUENCE (SIZE (1..maxCellMeas)) OF CellsToAddModCDMA2000

CellsToAddModCDMA2000 ::= SEQUENCE {
  cellIndex INTEGER (1..maxCellMeas),
  physCellId PhysCellIdCDMA2000
}

    physCellId PhysCellId,
    cellIndividualOffset Q-OffsetRange
}
BlackCellsToAddModList ::= SEQUENCE (SIZE (1..maxCellMeas)) OF BlackCellsToAddMod
BlackCellsToAddMod ::= SEQUENCE {
    cellIndex INTEGER (1..maxCellMeas),
    physCellIdRange PhysCellIdRange
}
-- ASN1STOP
```

MeasObjectEUTRA field descriptions

- **carrierFreq**
  Identifies E-UTRA carrier frequency for which this configuration is valid.

- **offsetFreq**
  Offset value applicable to the carrier frequency. Value dB-24 corresponds to -24 dB, dB-22 corresponds to -22 dB and so on.

- **cellsToRemoveList**
  List of cells to remove from the neighbouring cell list.

- **cellsToAddModList**
  List of cells to add/ modify in the neighbouring cell list.

- **cellIndex**
  Entry index in the neighbouring cell list. An entry may concern a range of cells, in which case this value applies to the entire range.

- **physCellId**
  Physical cell identity of a cell in neighbouring cell list.

- **cellIndividualOffset**
  Cell individual offset applicable to a specific neighbouring cell. Value dB-24 corresponds to -24 dB, dB-22 corresponds to -22 dB and so on.

- **blackCellsToRemoveList**
  List of cells to remove from the black list of cells.

- **blackCellsToAddModList**
  List of cells to add/ modify in the black list of cells.

- **physCellIdRange**
  Physical cell identity or a range of physical cell identities of cells in the black list.
**MeasObjectGERAN**

The IE *MeasObjectGERAN* specifies information applicable for inter-RAT GERAN neighbouring frequencies.

**MeasObjectGERAN information element**

```plaintext
MeasObjectGERAN ::= SEQUENCE {
  carrierFreqs  CarrierFreqsGERAN,
  offsetFreq    Q-OffsetRangeInterRAT DEFAULT 0,
  ncc-Permitted BIT STRING SIZE (8) DEFAULT '1111111'B,
  cellForWhichToReportCGI PhysCellIdGERAN OPTIONAL, -- Need ON
...}
```

**MeasObjectGERAN field descriptions**

- **ncc-Permitted** Field encoded as a bit map, where bit N is set to "0" if a BCCH carrier with NCC = N-1 is not permitted for monitoring and set to "1" if a BCCH carrier with NCC = N-1 is permitted for monitoring; N = 1 to 8; bit 1 of the bitmap is the leading bit of the bit string.

**MeasObjectId**

The IE *MeasObjectId* used to identify a measurement object configuration.

```plaintext
MeasObjectId ::= INTEGER (1..maxObjectId)
```

**MeasObjectToAddModList**

The IE *MeasObjectToAddModList* concerns a list of measurement objects to add or modify.

```plaintext
MeasObjectToAddModList ::= SEQUENCE (SIZE (1..maxObjectId)) OF MeasObjectToAddMod
MeasObjectToAddMod ::= SEQUENCE {
 _measObjectId  MeasObjectId,
  measObject    CHOICE {
    measObjectEUTRA    MeasObjectEUTRA,
    measObjectUTRA     MeasObjectUTRA,
    measObjectGERAN    MeasObjectGERAN,
    measObjectCDMA2000  MeasObjectCDMA2000,
...}
}
```

**MeasObjectUTRA**

The IE *MeasObjectUTRA* specifies information applicable for inter-RAT UTRA neighbouring cells.
MeasObjectUTRA information element

MeasObjectUTRA ::= SEQUENCE {
  carrierFreq  ARFCN-ValueUTRA,
  offsetFreq   Q-OffsetRangeInterRAT DEFAULT 0,
  cellsToRemoveList  CellIndexList OPTIONAL, -- Need ON
  cellsToAddModList CHOICE {
    cellsToAddModListUTRA-FDD  CellsToAddModListUTRA-FDD,
    cellsToAddModListUTRA-TDD  CellsToAddModListUTRA-TDD
  } OPTIONAL, -- Need ON
  cellForWhichToReportCGI CHOICE {
    utra-FDD  PhysCellIdUTRA-FDD,
    utra-TDD  PhysCellIdUTRA-TDD
  } OPTIONAL, -- Need ON
  ...,
  [[ csg-allowedReportingCells-v930  CSG-AllowedReportingCells-r9 OPTIONAL -- Need ON
  ]]
}

CellsToAddModListUTRA-FDD ::= SEQUENCE (SIZE (1..maxCell_meas)) OF CellsToAddModUTRA-FDD

CellsToAddModUTRA-FDD ::= SEQUENCE {
  cellIndex  INTEGER (1..maxCell_meas),
  physCellId  PhysCellIdUTRA-FDD
}

CellsToAddModListUTRA-TDD ::= SEQUENCE (SIZE (1..maxCell_meas)) OF CellsToAddModUTRA-TDD

CellsToAddModUTRA-TDD ::= SEQUENCE {
  cellIndex  INTEGER (1..maxCell_meas),
  physCellId  PhysCellIdUTRA-TDD
}

CSG-AllowedReportingCells-r9 ::= SEQUENCE {
  physCellIdRangeUTRA-FDDList-r9  PhysCellIdRangeUTRA-FDDList-r9 OPTIONAL -- Need OR
}

MeasObjectUTRA field descriptions

carrierFreq
Identifies UTRA carrier frequency for which this configuration is valid.

cellsToRemoveList
List of cells to remove from the neighbouring cell list.

cellsToAddModListUTRA-FDD
List of UTRA FDD cells to add/modify in the neighbouring cell list.

cellsToAddModListUTRA-TDD
List of UTRA TDD cells to add/modify in the neighbouring cell list.

cellIndex
Entry index in the neighbouring cell list.

csg-allowedReportingCells
One or more ranges of physical cell identities for which UTRA-FDD reporting is allowed.

MeasResults

The IE MeasResults covers measured results for intra-frequency, inter-frequency and inter-RAT mobility.

MeasResults information element

MeasResults ::= SEQUENCE {
  measId  MeasId,
  measResultServCell  SEQUENCE {
    rsrpResult  RSRP-Range,
    rsrqResult  RSRQ-Range

    ...[[ additionalSI-Info-r9 AdditionalSI-Info-r9 OPTIONAL
  }}
}
MeasResults field descriptions

measId
Identifies the measurement identity for which the reporting is being performed.

measResultServCell
Measured result of the serving cell.

measResultListEUTRA
List of measured results for the maximum number of reported best cells for an E-UTRA measurement identity.

rsrpResult
Measured RSRP result of an E-UTRA cell. The rsrpResult is only reported if configured by the eNB.

rsrqResult
Measured RSRQ result of an E-UTRA cell. The rsrqResult is only reported if configured by the eNB.

measResultListUTRA
List of measured results for the maximum number of reported best cells for a UTRA measurement identity.

measResultListGERAN
List of measured results for the maximum number of reported best cells or frequencies for a GERAN measurement identity.

measResultsCDMA2000
Contains the CDMA2000 HRPD pre-registration status and the list of CDMA2000 measurements.

preRegistrationStatusHRPD
Set to TRUE if the UE is currently pre-registered with CDMA2000 HRPD. Otherwise set to FALSE. This can be ignored by the eNB for CDMA2000 1xRTT.
MeasResults field descriptions

measResultListCDMA2000
List of measured results for the maximum number of reported best cells for a CDMA2000 measurement identity.

measResult
Measured result of an E-UTRA cell;
Measured result of a UTRA cell;
Measured result of a GERAN cell or frequency; or
Measured result of a CDMA2000 cell.
Measured result of UE Rx – Tx time difference.

utra-RSCP
spare values.

utra-EcN0
According to CPICH_Ec/No in TS 25.133 [29] for FDD. Fourteen spare values. The field is not present for TDD.

rssi
GERAN Carrier RSSI. RXLEV is mapped to a value between 0 and 63, TS 45.008 [28]. When mapping the RXLEV
value to the RSSI bit string, the first/leftmost bit of the bit string contains the most significant bit.

locationAreaCode
A fixed length code identifying the location area within a PLMN, as defined in TS 23.003 [27].

routingAreaCode
The RAC identity read from broadcast information, as defined in TS 23.003 [27].

plmn-IdentityList
The list of PLMN Identity read from broadcast information when the multiple PLMN Identities are broadcast. This field
contains the list of identities starting from the second entry of PLMN Identities in the broadcast information.

pilotPnPhase
Indicates the arrival time of a CDMA2000 pilot, measured relative to the UE’s time reference in units of PN chips, see
C.S0005-A [25]. This information is used in either SRVCC handover or enhanced 1xRTT CS fallback procedure to
CDMA2000 1xRTT.

pilotStrength
CDMA2000 Pilot Strength, the ratio of pilot power to total power in the signal bandwidth of a CDMA2000 Forward

csg-MemberStatus
Indicates whether or not the UE is a member of the CSG of the neighbour cell.

ue-RxTxTimeDiffResult
UE Rx-Tx time difference measurement result of the serving cell, provided by lower layers. According to UE Rx-Tx
time difference report mapping in TS 36.133 [16].

currentSFN
Indicates the current system frame number when receiving the UE Rx-Tx time difference measurement results from
lower layer.

---

QuantityConfig

The IE QuantityConfig specifies the measurement quantities and layer 3 filtering coefficients for E-UTRA and inter-
RAT measurements.

QuantityConfig information element

--- ASN1START

QuantityConfig ::= SEQUENCE {
  quantityConfigEUTRA          QuantityConfigEUTRA OPTIONAL, -- Need ON

**QuantityConfig field descriptions**

- **quantityConfigEUTRA**
  Specifies filter configurations for E-UTRA measurements.

- **quantityConfigUTRA**
  Specifies quantity and filter configurations for UTRA measurements.

- **measQuantityUTRA**
  Measurement quantity used for UTRA measurements.

- **quantityConfigGERAN**
  Specifies quantity and filter configurations for GERAN measurements.

- **measQuantityGERAN**
  Measurement quantity used for GERAN measurements.

- **quantityConfigCDMA2000**
  Specifies quantity configurations for CDMA2000 measurements.

- **measQuantityCDMA2000**
  Measurement quantity used for CDMA2000 measurements. *pilotPnPhaseAndPilotStrength* is only applicable for *MeasObjectCDMA2000* of *cdma2000-Type* = *type1XRTT*.

- **filterCoefficientRSRP**
  Specifies the filtering coefficient used for RSRP.

- **filterCoefficientRSRQ**
  Specifies the filtering coefficient used for RSRQ.

---

**ReportConfigEUTRA**

The IE *ReportConfigEUTRA* specifies criteria for triggering of an E-UTRA measurement reporting event. The E-UTRA measurement reporting events are labelled A\(_N\) with \(N\) equal to 1, 2 and so on.

- **Event A1**: Serving becomes better than absolute threshold;
- **Event A2**: Serving becomes worse than absolute threshold;
- **Event A3**: Neighbour becomes amount of offset better than serving;
- **Event A4**: Neighbour becomes better than absolute threshold;
- **Event A5**: Serving becomes worse than absolute threshold\(_1\) AND Neighbour becomes better than another absolute threshold\(_2\).

**ReportConfigEUTRA information element**

```
-- ASN1START
ReportConfigEUTRA ::= SEQUENCE {
  triggerType CHOICE {
    event CHOICE {
      eventId CHOICE {
        eventA1 SEQUENCE {
          a1-Threshold ThresholdEUTRA
        },
        eventA2 SEQUENCE {
          a2-Threshold ThresholdEUTRA
        },
        eventA3 SEQUENCE {
          a3-Offset INTEGER (-30..30),
          reportOnLeave BOOLEAN
        },
        eventA4 SEQUENCE {
```

---
ReportConfigEUTRA field descriptions

**eventId**
Choice of E-UTRA event triggered reporting criteria.

**aN-ThresholdM**
Threshold to be used in EUTRA measurement report triggering condition for event number aN. If multiple thresholds are defined for event number aN, the thresholds are differentiated by M.

**a3-Offset**
Offset value to be used in EUTRA measurement report triggering condition for event a3. The actual value is IE value * 0.5 dB.

**reportOnLeave**
Indicates whether or not the UE shall initiate the measurement reporting procedure when the leaving condition is met for a cell in `cellsTriggeredList`, as specified in 5.5.4.1.

**triggerQuantity**
The quantities used to evaluate the triggering condition for the event. The values rsrp and rsrq correspond to Reference Signal Received Power (RSRP) and Reference Signal Received Quality (RSRQ), see TS 36.214 [48].

**timeToTrigger**
Time during which specific criteria for the event needs to be met in order to trigger a measurement report.

**reportQuantity**
The quantities to be included in the measurement report. The value both means that both the rsrp and rsrq quantities are to be included in the measurement report.

**maxReportCells**
Max number of cells, excluding the serving cell, to include in the measurement report.

**reportAmount**
Number of measurement reports applicable for `triggerType` 'event' as well as for `triggerType` 'periodical'. In case `purpose` is set to 'reportCGI' only value 1 applies.

**ThresholdEUTRA**
For RSRP: RSRP based threshold for event evaluation. The actual value is IE value – 140 dBm.
For RSRQ: RSRQ based threshold for event evaluation. The actual value is (IE value – 40)/2 dB.

**si-RequestForHO**
The field applies to the 'reportCGI' functionality, and when the field is included, the UE is allowed to use autonomous gaps in acquiring system information from the neighbour cell, applies a different value for T321, and includes different fields in the measurement report.

**ue-RxTxTimeDiffPeriodical**
If this field is present, the UE shall perform UE Rx-Tx time difference measurement reporting and ignore the fields `triggerQuantity`, `reportQuantity` and `maxReportCells`. If the field is present, the only applicable values for the corresponding `triggerType` and `purpose` are 'periodical' and 'reportStrongestCells' respectively.
Conditional presence | Explanation
--- | ---
reportCGI | The field is optional, need OR in case 'purpose' is included and set to 'reportCGI'; otherwise the field is not present.

— ReportConfigId

The IE ReportConfigId is used to identify a measurement reporting configuration.

**ReportConfigId information element**

```
-- ASN1START
ReportConfigId ::= INTEGER (1..maxReportConfigId)
-- ASN1STOP
```

— ReportConfigInterRAT

The IE ReportConfigInterRAT specifies criteria for triggering of an inter-RAT measurement reporting event. The inter-RAT measurement reporting events are labelled BN with N equal to 1, 2 and so on.

Event B1: Neighbour becomes better than absolute threshold;
Event B2: Serving becomes worse than absolute threshold1 AND Neighbour becomes better than another absolute threshold2.

The b1 and b2 event thresholds for CDMA2000 are the CDMA2000 pilot detection thresholds are expressed as an unsigned binary number equal to [-2 x 10 log 10 E/Io] in units of 0.5dB, see C.S0005-A [25] for details.

**ReportConfigInterRAT information element**

```
-- ASN1START
ReportConfigInterRAT ::= SEQUENCE {
    triggerType  CHOICE {
        event  SEQUENCE {
            eventId  CHOICE {

ThresholdUTRA ::= CHOICE{
  utra-RSCP INTEGER (-5..91),
  utra-EcN0 INTEGER (0..49)
}
ThresholdGERAN ::= INTEGER (0..63)
ThresholdCDMA2000 ::= INTEGER (0..63)

---

ReportConfigInterRAT field descriptions

- **eventId**
  Choice of inter-RAT event triggered reporting criteria.

- **bN-ThresholdM**
  Threshold to be used in inter RAT measurement report triggering condition for event number bN. If multiple thresholds are defined for event number bN, the thresholds are differentiated by M.

- **timeToTrigger**
  Time during which specific criteria for the event needs to be met in order to trigger a measurement report.

- **Purpose**
  reportStrongestCellsForSON applies only in case reportConfig is linked to a measObject set to ‘measObjectUTRA’ or ‘measObjectCDMA2000’.

- **maxReportCells**
  Max number of cells, excluding the serving cell, to include in the measurement report. In case purpose is set to ‘reportStrongestCellsForSON’ only value 1 applies.

- **reportAmount**
  Number of measurement reports applicable for triggerType ‘event’ as well as for triggerType ‘periodical’. In case purpose is set to ‘reportCGI’ or ‘reportStrongestCellsForSON’ only value 1 applies.

ThresholdUTRA
utra-EcN0 corresponds to CPICH_Ec/No in TS 25.133 [29] for FDD, and is not applicable for TDD.
For utra-RSCP: The actual value is IE value – 115 dBm.
For utra-EcN0: The actual value is ((IE value – 49)/2) dB.

ThresholdGERAN
The actual value is IE value – 110 dBm.

si-RequestForHO
The field applies to the ‘reportCGI’ functionality, and when the field is included, the UE is allowed to use autonomous gaps in acquiring system information from the neighbour cell, applies a different value for T321, and includes different fields in the measurement report.

---

Conditional presence | Explanation
--- | ---
reportCGI | The field is optional, need OR, in case ‘purpose’ is included and set to ‘reportCGI’, otherwise the field is not present.

---

ReportConfigToAddModList
The IE ReportConfigToAddModList concerns a list of reporting configurations to add or modify.

---

ReportConfigToAddModList information element

---

3GPP
ReportInterval

The ReportInterval indicates the interval between periodical reports. The ReportInterval is applicable if the UE performs periodical reporting (i.e. when reportAmount exceeds 1), for triggerType 'event' as well as for triggerType 'periodical'. Value ms120 corresponds with 120 ms, ms240 corresponds with 240 ms and so on, while value min1 corresponds with 1 min, min6 corresponds with 6 min and so on.

**ReportInterval information element**

```asn1
ReportInterval ::= ENUMERATED {
    ms120, ms240, ms480, ms640, ms1024, ms2048, ms5120, ms10240,
    min1, min6, min12, min30, min60, spare3, spare2, spare1}
```

RSRP-Range

The IE RSRP-Range specifies the value range used in RSRP measurements and thresholds. Integer value for RSRP measurements according to mapping table in TS 36.133 [16].

**RSRP-Range information element**

```asn1
RSRP-Range ::= INTEGER(0..97)
```

RSRQ-Range

The IE RSRQ-Range specifies the value range used in RSRQ measurements and thresholds. Integer value for RSRQ measurements according to mapping table in TS 36.133 [16].

**RSRQ-Range information element**

```asn1
RSRQ-Range ::= INTEGER(0..34)
```

TimeToTrigger

The IE TimeToTrigger specifies the value range used for time to trigger parameter, which concerns the time during which specific criteria for the event needs to be met in order to trigger a measurement report. Value ms0 corresponds to 0 ms, ms40 corresponds to 40 ms, and so on.

**TimeToTrigger information element**

```asn1
TimeToTrigger ::= ENUMERATED {
    ms0, ms40, ms64, ms80, ms100, ms128, ms160, ms256,
    ms320, ms480, ms512, ms640, ms1024, ms1280, ms2560,
    ms5120}
```
6.3.6 Other information elements

– **C-RNTI**

The IE C-RNTI identifies a UE having a RRC connection within a cell.

**C-RNTI information element**

```plaintext
-- ASN1START
C-RNTI ::= BIT STRING (SIZE (16))
-- ASN1STOP
```

– **DedicatedInfoCDMA2000**

The DedicatedInfoCDMA2000 is used to transfer UE specific CDMA2000 information between the network and the UE. The RRC layer is transparent for this information.

**DedicatedInfoCDMA2000 information element**

```plaintext
-- ASN1START
DedicatedInfoCDMA2000 ::= OCTET STRING
-- ASN1STOP
```

– **DedicatedInfoNAS**

The IE DedicatedInfoNAS is used to transfer UE specific NAS layer information between the network and the UE. The RRC layer is transparent for this information.

**DedicatedInfoNAS information element**

```plaintext
-- ASN1START
DedicatedInfoNAS ::= OCTET STRING
-- ASN1STOP
```

– **FilterCoefficient**

The IE FilterCoefficient specifies the measurement filtering coefficient. Value fc0 corresponds to k = 0, fc1 corresponds to k = 1, and so on.

**FilterCoefficient information element**

```plaintext
-- ASN1START
FilterCoefficient ::= ENUMERATED {
  fc0, fc1, fc2, fc3, fc4, fc5,
  fc6, fc7, fc8, fc9, fc11, fc13,
  fc15, fc17, fc19, spare1, ...}
-- ASN1STOP
```

– **MMEC**

The IE MMEC identifies an MME within the scope of an MME Group within a PLMN, see TS 23.003 [27].
**MMEC information element**

```plaintext
MMEC ::= BIT STRING (SIZE (8))
```

**NeighCellConfig**

The IE `NeighCellConfig` is used to provide the information related to MBSFN and TDD UL/DL configuration of neighbour cells.

**NeighCellConfig information element**

```plaintext
NeighCellConfig ::= BIT STRING (SIZE (2))
```

**NeighCellConfig field descriptions**

<table>
<thead>
<tr>
<th>NeighCellConfig</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Not all neighbour cells have the same MBSFN subframe allocation as serving cell</td>
</tr>
<tr>
<td>10</td>
<td>The MBSFN subframe allocations of all neighbour cells are identical to or subsets of that in the serving cell</td>
</tr>
<tr>
<td>01</td>
<td>No MBSFN subframes are present in all neighbour cells</td>
</tr>
<tr>
<td>11</td>
<td>Different UL/DL allocation in neighbouring cells for TDD compared to the serving cell</td>
</tr>
</tbody>
</table>

For TDD, 00, 10 and 01 are only used for same UL/DL allocation in neighbouring cells compared to the serving cell.

**OtherConfig**

The IE `OtherConfig` contains configuration related to other configuration.

**OtherConfig information element**

```plaintext
OtherConfig-r9 ::= SEQUENCE {
  reportProximityConfig-r9                 ReportProximityConfig-r9 OPTIONAL, -- Need ON
  ...                                      ...
}
ReportProximityConfig-r9 ::= SEQUENCE {
  proximityIndicationEUTRA-r9             ENUMERATED {enabled} OPTIONAL, -- Need OR
  proximityIndicationUTRA-r9             ENUMERATED {enabled} OPTIONAL, -- Need OR
}
```

**OtherConfig field descriptions**

<table>
<thead>
<tr>
<th>reportProximityConfig</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Indicate, for each of the applicable RATs (EUTRA, UTRA), whether or not proximity indication is enabled for cells of the concerned RAT whose CSG IDs are in the UEs CSG whitelist. Note.</td>
<td></td>
</tr>
</tbody>
</table>

**NOTE:** Enabling/ disabling of proximity indication includes enabling/ disabling of the related functionality e.g. autonomous search in connected mode.

**RAND-CDMA2000 (1xRTT)**

The `RAND-CDMA2000` concerns a random value, generated by the eNB, to be passed to the CDMA2000 upper layers.
**RAND-CDMA2000 information element**

```asn1
RAND-CDMA2000 ::= BIT STRING (SIZE (32))
```

**RAT-Type**

The IE *RAT-Type* is used to indicate the radio access technology (RAT), including E-UTRA, of the requested/transferred UE capabilities.

**RAT-Type information element**

```asn1
RAT-Type ::= ENUMERATED {
  eutra, utra, geran-cs, geran-ps, cdma2000-1XRTT,
  spare3, spare2, spare1, ...
}
```

**RRC-TransactionIdentifier**

The IE *RRC-TransactionIdentifier* is used, together with the message type, for the identification of an RRC procedure (transaction).

**RRC-TransactionIdentifier information element**

```asn1
RRC-TransactionIdentifier ::= INTEGER (0..3)
```

**S-TMSI**

The IE *S-TMSI* contains an S-Temporary Mobile Subscriber Identity, a temporary UE identity provided by the EPC which uniquely identifies the UE within the tracking area, see TS 23.003 [27].

**S-TMSI information element**

```asn1
S-TMSI ::= SEQUENCE {
  mmec MMSEC,
  m-TMSI BIT STRING (SIZE (32))
}
```

**S-TMSI field descriptions**

*m-TMSI*

The first/leftmost bit of the bit string contains the most significant bit of the M-TMSI.

**UE-CapabilityRAT-ContainerList**

The IE *UE-CapabilityRAT-ContainerList* contains list of containers, one for each RAT for which UE capabilities are transferred, if any.
UE-CapabilityRAT-ContainerList information element

```
-- ASN1START
UE-CapabilityRAT-ContainerList ::= SEQUENCE (SIZE (0..maxRAT-Capabilities)) OF UE-CapabilityRAT-Container
UE-CapabilityRAT-Container ::= SEQUENCE {
    rat-Type                  RAT-Type,
    ueCapabilityRAT-Container OCTET STRING
}
-- ASN1STOP
```

**UE-CapabilityRAT-Container field descriptions**

Container for the UE capabilities of the indicated RAT. The encoding is defined in the specification of each RAT:

For E-UTRA: the encoding of UE capabilities is defined in IE **EUTRA-Capability**.

For UTRA: the octet string contains the INTER RAT HANDOVER INFO message defined in TS 25.331 [19].

For GERAN CS: the octet string contains the concatenated string of the Mobile Station Classmark 2 and Mobile Station Classmark 3. The Mobile Station Classmark 2 is formatted as 'TLV' and is coded in the same way as the **Mobile Station Classmark 2** information element in TS 24.008 [49]. The first octet is the **Mobile station classmark 2 IEl** and its value shall be set to 33H. The second octet is the **Length of mobile station classmark 2** and its value shall be set to 3. The octet 3 contains the first octet of the value part of the **Mobile Station Classmark 2** information element, the octet 4 contains the second octet of the value part of the **Mobile Station Classmark 2** information element and so on. For each of these octets, the first/ leftmost/ most significant bit of the octet contains b8 of the corresponding octet of the Mobile Station Classmark 2. The Mobile Station Classmark 3 is formatted as 'V' and is coded in the same way as the value part in the **Mobile station classmark 3** information element in TS 24.008 [49]. The sixth octet of this octet string contains octet 1 of the value part of **Mobile station classmark 3**, the seventh of octet of this octet string contains octet 2 of the value part of **Mobile station classmark 3** and so on. Note.

For GERAN PS: the encoding of UE capabilities is formatted as 'V' and is coded in the same way as the value part in the **MS Radio Access Capability** information element in TS 24.008 [49]. For CDMA2000-1xRTT: the octet string contains the A21 Mobile Subscription Information and the encoding of this is defined in A.50008 [33]. The A21 Mobile Subscription Information contains the supported CDMA2000 1xRTT band class and band sub-class information.

**NOTE:** The value part is specified by means of CSN.1, which encoding results in a bit string, to which final padding may be appended up to the next octet boundary TS 24.008 [49]. The first/ leftmost/ most significant bit of the CSN.1 bit string is placed in the first/ leftmost/ least significant bit of the first octet. This continues until the last bit of the CSN.1 bit string, which is placed in the last/ rightmost/ least significant bit of the last octet.

**-- UE-EUTRA-Capability**

The IE **UE-EUTRA-Capability** is used to convey the E-UTRA UE Radio Access Capability Parameters, see TS 36.306 [5], to the network. The IE **UE-EUTRA-Capability** is transferred in E-UTRA or in another RAT.

**UE-EUTRA-Capability information element**

</tbody>
</table>

### `bandListEUTRA`

One entry corresponding to each supported E-UTRA band listed in the same order as in `supportedBandListEUTRA`.

### `interFreqBandList`

One entry corresponding to each supported E-UTRA band listed in the same order as in `supportedBandListEUTRA`.

### `interFreqNeedForGaps`

Indicates need for measurement gaps when operating on the E-UTRA band given by the entry in `bandListEUTRA` and measuring on the E-UTRA band given by the entry in `interFreqBandList`.

### `interRAT-BandList`

One entry corresponding to each supported band of another RAT listed in the same order as in the `interRAT-Parameters`.

### `interRAT-NeedForGaps`

Indicates need for DL measurement gaps when operating on the E-UTRA band given by the entry in `bandListEUTRA` and measuring on the inter-RAT band given by the entry in the `interRAT-BandList`.

### `SupportedBandUTRA-FDD`

UTRA band as defined in TS 25.101 [17].

### `SupportedBandUTRA-TDD128`

UTRA band as defined in TS 25.102 [18].

### `SupportedBandUTRA-TDD384`

UTRA band as defined in TS 25.102 [18].

### `SupportedBandUTRA-TDD768`

UTRA band as defined in TS 25.102 [18].

### `SupportedBandGERAN`

GERAN band as defined in TS 45.005 [20].

### `dtm`

Indicates whether the UE supports DTM in GERAN.

### `SupportedBandListHRPD`

One entry corresponding to each supported CDMA2000 HRPD band class.

### `SupportedBandList1xRTT`

One entry corresponding to each supported CDMA2000 1xRTT band class.

### `interRAT-PS-HO-ToGERAN`

Indicates whether the UE supports inter-RAT PS handover to GERAN or not.

### `featureGroupIndicators`

The definitions of the bits in the bit string are described in Annex B.

### `e-CSFB-1XRTT`

Indicates whether the UE supports enhanced CS fallback to CDMA2000 1xRTT or not.

### `e-CSFB-ConcPS-Mob1XRTT`

Indicates whether the UE supports concurrent enhanced CS fallback to CDMA2000 1xRTT and PS handover/ redirection to CDMA2000 HRPD.

### `enhancedDualLayerTDD-Supported`

Indicates whether the UE supports enhanced dual layer (PDSCH transmission mode 8) for TDD or not. This bit shall be set to “TRUE” by a Rel-9 TDD UE when the functionality has been IOT tested.

### `deviceType`

UE may set the value to “noBenFromBatConsumpOpt” when it does not foresee to particularly benefit from NW-based battery consumption optimisation. Absence of this value means that the device does benefit from NW-based battery consumption optimisation.

**NOTE:** The IE `UE-EUTRA-Capability` does not include AS security capability information, since these are the same as the security capabilities that are signalled by NAS. Consequently AS need not provide “man-in-the-middle” protection for the security capabilities.
— **UE-TimersAndConstants**

The IE *UE-TimersAndConstants* contains timers and constants used by the UE in either RRC_CONNECTED or RRC_IDLE.

**UE-TimersAndConstants** information element

```asn1
UE-TimersAndConstants ::= SEQUENCE {
  t300 ENUMERATED {
    ms100, ms200, ms300, ms400, ms600, ms1000, ms1500,
    ms2000},
  t301 ENUMERATED {
    ms100, ms200, ms300, ms400, ms600, ms1000, ms1500,
    ms200},
  t310 ENUMERATED {
    ms0, ms50, ms100, ms200, ms500, ms1000, ms2000},
  n310 ENUMERATED {
    n1, n2, n3, n4, n6, n8, n10, n20},
  t311 ENUMERATED {
    ms1000, ms3000, ms5000, ms10000, ms15000,
    ms20000, ms30000},
  n311 ENUMERATED {
    n1, n2, n3, n4, n5, n6, n8, n10},
  ...
}
```

**UE-TimersAndConstants** field descriptions

| t3xy | Timers are described in section 7.3. Value ms0 corresponds with 0 ms, ms50 corresponds with 50 ms and so on. |
| n3xy | Constants are described in section 7.4. n1 corresponds with 1, n2 corresponds with 2 and so on. |

6.3.7 **MBMS information elements**

— **MBMS-NotificationConfig**

The IE *MBMS-NotificationConfig* specifies the MBMS notification related configuration parameters, that are applicable for all MBSFN areas.

**MBMS-NotificationConfig** information element

```asn1
MBMS-NotificationConfig-r9 ::= SEQUENCE {
  notificationRepetitionCoeff-r9 ENUMERATED {n2, n4},
  notificationOffset-r9 INTEGER (0..10),
  notificationSF-Index-r9 INTEGER (1..6)
}
```

### 3GPP
MBMS-NotificationConfig field descriptions

**notificationRepetitionCoeff**
Actual change notification repetition period common for all MCCHs that are configured= shortest modification period/ notificationRepetitionCoeff. The 'shortest modification period' corresponds with the lowest value of mcch-ModificationPeriod of all MCCHs that are configured. Value n2 corresponds to coefficient 2, and so on.

**notificationOffset**
Indicates, together with the notificationRepetitionCoeff, the radio frames in which the MCCH information change notification is scheduled i.e. the MCCH information change notification is scheduled in radio frames for which: SFN mod notification repetition period = notificationOffset

**notificationSF-Index**
Indicates the subframe used to transmit MCCH change notifications on PDCCH. FDD: Value 1, 2, 3, 4, 5 and 6 correspond with subframe #1, #2, #3, #6, #7, and #8 respectively. TDD: Value 1, 2, 3, 4, and 5 correspond with subframe #3, #4, #7, #8, and #9 respectively.

---

**MBSFN-AreaInfoList**
The IE MBSFN-AreaInfoList contains the information required to acquire the MBMS control information associated with one or more MBSFN areas.

**MBSFN-AreaInfoList information element**

```
-- ASN1START
MBSFN-AreaInfoList-r9 ::= SEQUENCE (SIZE(1..maxMBSFN-Area)) OF MBSFN-AreaInfo-r9
MBSFN-AreaInfo-r9 ::= SEQUENCE {
  mbsfn-AreaId-r9 ::= INTEGER (0..255),
  non-MBSFNregionLength ::= ENUMERATED {s1, s2},
  notificationIndicator-r9 ::= INTEGER (0..7),
  mcch-Config-r9 ::= SEQUENCE {
    mcch-RepetitionPeriod-r9 ::= ENUMERATED {rf32, rf64, rf128, rf256},
    mcch-Offset-r9 ::= INTEGER (0..10),
    mcch-ModificationPeriod-r9 ::= ENUMERATED {rf512, rf1024},
    sf-AllocInfo-r9 ::= BIT STRING (SIZE(6)),
    signallingMCS-r9 ::= ENUMERATED {n2, n7, n13, n19}
  },
  ...,
}  -- ASN1STOP
```
### MBSFN-AreaInfoList field descriptions

- **mbsfn-AreaId**
  Indicates the MBSFN area ID, parameter $N_0^{MBSFN}$ in TS 36.211 [21, 6.10.2.1].

- **signallingMCS**
  Indicates the Modulation and Coding Scheme (MCS) applicable for the subframes indicated by the field $sf$-AllocInfo and for the first subframe of each MCH scheduling period (which may contain the MCH scheduling information provided by MAC). Value $n2$ corresponds with the value 2 for parameter $I_{MCS}$ in TS 36.213 [23, Table 7.1.7.1-1], and so on.

- **non-MBSFNregionLength**
  Indicates how many symbols from the beginning of the subframe constitute the non-MBSFN region. This value applies in all subframes of the MBSFN area used for PMCH transmissions as indicated in the MSI. The values $s1$ and $s2$ correspond with 1 and 2 symbols, respectively: see TS 36.211 [21, Table 6.7-1].

- **notificationIndicator**
  Indicates which PDCCH bit is used to notify the UE about change of the MCCH applicable for this MBSFN area. Value 0 corresponds with the least significant bit as defined in TS 36.212 [22, Section 5.3.3.1] and so on.

- **mcch-RepetitionPeriod**
  Defines the interval between transmissions of MCCH information, in radio frames, Value rf32 corresponds to 32 radio frames, rf64 corresponds to 64 radio frames and so on.

- **mcch-Offset**
  Indicates, together with the mcch-RepetitionPeriod, the radio frames in which MCCH is scheduled i.e. MCCH is scheduled in radio frames for which: SFN mod mcch-RepetitionPeriod = mcch-Offset

- **mcch-ModificationPeriod**
  Defines periodically appearing boundaries, i.e. radio frames for which SFN mod mcch-ModificationPeriod = 0. The contents of different transmissions of MCCH information can only be different if there is at least one such boundary in-between them.

- **sf-AllocInfo**
  Indicates the subframes of the radio frames indicated by the mcch-RepetitionPeriod and the mcch-Offset, that may carry MCCH. Value “1” indicates that the corresponding subframe is allocated. The following mapping applies:
  - FDD: The first/ leftmost bit defines the allocation for subframe #1 of the radio frame indicated by mcch-RepetitionPeriod and mcch-Offset, the second bit for #2, the third bit for #3, the fourth bit for #6, the fifth bit for #7 and the sixth bit for #8.
  - TDD: The first/leftmost bit defines the allocation for subframe #3 of the radio frame indicated by mcch-RepetitionPeriod and mcch-Offset, the second bit for #4, third bit for #7, fourth bit for #8, fifth bit for #9. Uplink subframes are not allocated. The last bit is not used.

---

### MBSFN-SubframeConfig

The IE MBSFN-SubframeConfig defines subframes that are reserved for MBSFN in downlink.

---

```asn1
MBSFN-SubframeConfig ::= SEQUENCE {
  radioframeAllocationPeriod ENUMERATED {n1, n2, n4, n8, n16, n32},
  radioframeAllocationOffset INTEGER (0..7),
  subframeAllocation CHOICE {
    oneFrame BIT STRING (SIZE(6)),
    fourFrames BIT STRING (SIZE(24))
  }
}
```

---
MBSFN-SubframeConfig field descriptions

radioFrameAllocationPeriod, radioFrameAllocationOffset
Radio-frames that contain MBSFN subframes occur when equation SFN mod radioFrameAllocationPeriod = radioFrameAllocationOffset is satisfied. Value n1 for radioframeAllocationPeriod denotes value 1, n2 denotes value 2, and so on. When fourFrames is used for subframeAllocation, the equation defines the first radio frame referred to in the description below. Values n1 and n2 are not applicable when fourFrames is used.

subframeAllocation
Defines the subframes that are allocated for MBSFN within the radio frame allocation period defined by the radioFrameAllocationPeriod and the radioFrameAllocationOffset.

oneFrame
“1” denotes that the corresponding subframe is allocated for MBSFN. The following mapping applies:
FDD: The first/leftmost bit defines the MBSFN allocation for subframe #1, the second bit for #2, third bit for #3, fourth bit for #6, fifth bit for #7, sixth bit for #8.
TDD: The first/leftmost bit defines the allocation for subframe #3, the second bit for #4, third bit for #7, fourth bit for #8, fifth bit for #9. Uplink subframes are not allocated. The last bit is not used.

fourFrames
A bit-map indicating MBSFN subframe allocation in four consecutive radio frames, “1” denotes that the corresponding subframe is allocated for MBSFN. The bitmap is interpreted as follows:
FDD: Starting from the first radioframe and from the first/leftmost bit in the bitmap, the allocation applies to subframes #1, #2, #3, #6, #7, and #8 in the sequence of the four radio-frames.
TDD: Starting from the first radioframe and from the first/leftmost bit in the bitmap, the allocation applies to subframes #3, #4, #7, #8, and #9 in the sequence of the four radio-frames. The last four bits are not used. Uplink subframes are not allocated.

PMCH-InfoList
The IE PMCH-InfoList specifies configuration of all PMCHs of an MBSFN area. The information provided for an individual PMCH includes the configuration parameters of the sessions that are carried by the concerned PMCH.

PMCH-InfoList information element

```
-- ASN1START
PMCH-InfoList-r9 ::= SEQUENCE (SIZE (0..maxPMCH-PerMBSFN)) OF PMCH-Info-r9
PMCH-Info-r9 ::= SEQUENCE {
    pmchConfig-r9            PMCH-Config-r9,

PMCH-InfoList field descriptions

sessionId Indicates the optional MBMS Session Identity, which together with TMGI identifies a transmission or a possible retransmission of a specific MBMS session: see TS 29.061 [51, Sections 20.5, 17.7.11, 17.7.15]. The field is included whenever upper layers have assigned a session identity i.e. one is available for the MBMS session in E-UTRAN.

sf-AllocEnd Indicates the last subframe allocated to this (P)MCH within a period identified by field commonSF-AllocPeriod. The subframes allocated to (P)MCH corresponding with the rth entry in pmch-InfoList are the subsequent subframes starting from either the subframe identified by sf-AllocEnd of the (n-1)th listed (P)MCH or, for n=1, the first subframe, through the subframe identified by sf-AllocEnd of the nth listed (P)MCH. Value 0 corresponds with the first subframe defined by field commonSF-Alloc.

mch-SchedulingPeriod Indicates the MCH scheduling period i.e. the periodicity used for providing MCH scheduling information at lower layers (MAC) applicable for an MCH. Value r8 corresponds to 8 radio frames, r16 corresponds to 16 radio frames and so on.

dataMCS Indicates the value for parameter I_{MCS} in TS 36.213 [23, Table 7.1.7.1-1], which defines the Modulation and Coding Scheme (MCS) applicable for the subframes of this (P)MCH as indicated by the field commonSF-Alloc. The MCS does however neither apply to the subframes that may carry MCH i.e. the subframes indicated by the field sf-AllocInfo within SystemInformationBlockType13 nor for the first subframe of each MCH scheduling period (which may contain the MCH scheduling information provided by MAC).

plmn-Index Index of the entry in field plmn-IdentityList within SystemInformationBlockType1.

sessionId Identifies the identity of a session of an MBMS service.

serviceld Uniquely identifies the identity of an MBMS service within a PLMN. The field contains octet 3-5 of the IE Temporary Mobile Group Identity (TMGI) as defined in TS 24.008 [49]. The first octet contains the third octet of the TMGI, the second octet contains the fourth octet of the TMGI and so on.

### 7 UE variables

**NOTE:** To facilitate the specification of the UE behavioural requirements, UE variables are represented using ASN.1. Unless explicitly specified otherwise, it is however up to UE implementation how to store the variables. The optionality of the IEs in ASN.1 is used only to indicate that the values may not always be available.

---

**EUTRA-UE-Variables**

This ASN.1 segment is the start of the E-UTRA UE variable definitions.

---

```asn1
EUTRA-UE-Variables DEFINITIONS AUTOMATIC TAGS ::= BEGIN IMPORTS
  CarrierFreqGERAN, CellIdentity, SpeedStateScaleFactors, C-RNTI, MeasId, MeasIdToAddModList, MeasObjectToAddModList, MobilityStateParameters, NeighCellConfig, PhysCellId, PhysCellIdCDMA2000, PhysCellIdGERAN, PhysCellIdUTRA-FDD, PhysCellIdUTRA-TDD, QuantityConfig, ReportConfigToAddModList, RSRP-Range, maxCellMeas, maxMeasId FROM EUTRA-RRC-Definitions; -- ASN1STOP
```
The UE variable VarMeasConfig includes the accumulated configuration of the measurements to be performed by the UE, covering intra-frequency, inter-frequency and inter-RAT mobility related measurements.

**VarMeasConfig UE variable**

```
-- ASN1START
VarMeasConfig ::= SEQUENCE {
  -- Measurement identities
  measIdList                    MeasIdToAddModList OPTIONAL,
  -- Measurement objects
  measObjectList                MeasObjectToAddModList OPTIONAL,
  -- Reporting configurations
  reportConfigList              ReportConfigToAddModList OPTIONAL,
  -- Other parameters
  quantityConfig                QuantityConfig OPTIONAL,
  s-Measure                     RSRP-Range OPTIONAL,
  speedStatePars                CHOICE {
    release                      NULL,
    setup                        SEQUENCE {
      mobilityStateParameters     MobilityStateParameters,
      timeToTrigger-SF           SpeedStateScaleFactors
    } OPTIONAL
  }
}
-- ASN1STOP
```

The UE variable VarMeasReportList includes information about the measurements for which the triggering conditions have been met.

**VarMeasReportList UE variable**

```
-- ASN1START
VarMeasReportList ::= SEQUENCE (SIZE (1..maxMeasId)) OF VarMeasReport
VarMeasReport ::= SEQUENCE {
  -- List of measurement that have been triggered
  measId                      MeasId,
  cellsTriggeredList          CellsTriggeredList OPTIONAL,
  numberOfReportsSent         INTEGER
}
CellsTriggeredList ::= SEQUENCE (SIZE (1..maxCellMeas)) OF CHOICE {
  physCellIdEUTRA             PhysCellIdEUTRA,
  physCellIdUTRA              CHOICE {
    fdd                        PhysCellIdUTRA-FDD,
    tdd                        PhysCellIdUTRA-TDD
  },
  physCellIdGERAN             CarrierFreq
  physCellId                 PhysCellIdGERAN
  physCellIdCDMA2000          PhysCellIdCDMA2000
}
-- ASN1STOP
```

The UE variable VarShortMAC-Input specifies the input used to generate the shortMAC-I.

**VarShortMAC-Input UE variable**

```
-- ASN1START
```
VarShortMAC-Input ::= SEQUENCE {
  cellIdentity CellIdentity,
  physCellId PhysCellId,
  c-RNTI C-RNTI
}
-- ASN1STOP

8 Protocol data unit abstract syntax

8.1 General

The RRC PDU contents in clause 6 and clause 10 are described using abstract syntax notation one (ASN.1) as specified in ITU-T Rec. X.680 [13] and X.681 [14]. Transfer syntax for RRC PDUs is derived from their ASN.1 definitions by use of Packed Encoding Rules, unaligned as specified in ITU-T Rec. X.691 [15].

The following encoding rules apply in addition to what has been specified in X.691:

- When a bit string value is placed in a bit-field as specified in 15.6 to 15.11 in X.691, the leading bit of the bit string value shall be placed in the leading bit of the bit-field, and the trailing bit of the bit string value shall be placed in the trailing bit of the bit-field.

NOTE: The terms ‘leading bit’ and ‘trailing bit’ are defined in ITU-T Rec. X.680. When using the ‘bstring’ notation, the leading bit of the bit string value is on the left, and the trailing bit of the bit string value is on the right.

- When decoding types constrained with the ASN.1 Contents Constraint ("CONTAINING"), automatic decoding of the contained type should not be performed because errors in the decoding of the contained type should not cause the decoding of the entire RRC message PDU to fail. It is recommended that the decoder first decodes the outer PDU type that contains the OCTET STRING or BIT STRING with the Contents Constraint, and then decodes the contained type that is nested within the OCTET STRING or BIT STRING as a separate step.

- When decoding a) RRC message PDUs, b) BIT STRING constrained with a Contents Constraint, or c) OCTET STRING constrained with a Contents Constraint, PER decoders are required to never report an error if there are extraneous zero or non-zero bits at the end of the encoded RRC message PDU, BIT STRING or OCTET STRING.

8.2 Structure of encoded RRC messages

An RRC PDU, which is the bit string that is exchanged between peer entities across the radio interface contains the basic production as defined in X.691.

RRC PDUs shall be mapped to and from PDCP SDUs (in case of DCCH) or RLC SDUs (in case of PCCH, BCCH, CCCH or MCCH) upon transmission and reception as follows:

- when delivering an RRC PDU as an PDCP SDU to the PDCP layer for transmission, the first bit of the RRC PDU shall be represented as the first bit in the PDCP SDU and onwards; and

- when delivering an RRC PDU as an RLC SDU to the RLC layer for transmission, the first bit of the RRC PDU shall be represented as the first bit in the RLC SDU and onwards; and

- upon reception of an PDCP SDU from the PDCP layer, the first bit of the PDCP SDU shall represent the first bit of the RRC PDU and onwards; and

- upon reception of an RLC SDU from the RLC layer, the first bit of the RLC SDU shall represent the first bit of the RRC PDU and onwards.
8.3 Basic production

The 'basic production' is obtained by applying UNALIGNED PER to the abstract syntax value (the ASN.1 description) as specified in X.691. It always contains a multiple of 8 bits.

8.4 Extension

The following rules apply with respect to the use of protocol extensions:

- A transmitter compliant with this version of the specification shall, unless explicitly indicated otherwise on a PDU type basis, set the extension part empty. Transmitters compliant with a later version may send non-empty extensions;
- A transmitter compliant with this version of the specification shall set spare bits to zero;

8.5 Padding

If the encoded RRC message does not fill a transport block, the RRC layer shall add padding bits. This applies to PCCH and BCCH.

Padding bits shall be set to 0 and the number of padding bits is a multiple of 8.

9 Specified and default radio configurations

Specified and default configurations are configurations of which the details are specified in the standard. Specified configurations are fixed while default configurations can be modified using dedicated signalling.
9.1 Specified configurations

9.1.1 Logical channel configurations

9.1.1.1 BCCH configuration

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Semantics description</th>
<th>Ver</th>
</tr>
</thead>
<tbody>
<tr>
<td>PDCP configuration</td>
<td>N/A</td>
<td></td>
<td></td>
</tr>
<tr>
<td>RLC configuration</td>
<td>TM</td>
<td></td>
<td></td>
</tr>
<tr>
<td>MAC configuration</td>
<td>TM</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

NOTE: RRC will perform padding, if required due to the granularity of the TF signalling, as defined in 8.5.

9.1.1.2 CCCH configuration

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Semantics description</th>
<th>Ver</th>
</tr>
</thead>
<tbody>
<tr>
<td>PDCP configuration</td>
<td>N/A</td>
<td></td>
<td></td>
</tr>
<tr>
<td>RLC configuration</td>
<td>TM</td>
<td></td>
<td></td>
</tr>
<tr>
<td>MAC configuration</td>
<td>Normal MAC headers are used</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Logical channel configuration</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>priority</td>
<td>1</td>
<td>Highest priority</td>
<td></td>
</tr>
<tr>
<td>prioritisedBitRate</td>
<td>infinity</td>
<td></td>
<td></td>
</tr>
<tr>
<td>bucketSizeDuration</td>
<td>N/A</td>
<td></td>
<td></td>
</tr>
<tr>
<td>logicalChannelGroup</td>
<td>0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>logicalChannelIDSR-Mask-r9</td>
<td>release</td>
<td></td>
<td>v920</td>
</tr>
</tbody>
</table>

NOTE: RRC will perform padding, if required due to the granularity of the TF signalling, as defined in 8.5.

9.1.1.3 PCCH configuration

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Semantics description</th>
<th>Ver</th>
</tr>
</thead>
<tbody>
<tr>
<td>PDCP configuration</td>
<td>N/A</td>
<td></td>
<td></td>

10 Radio information related interactions between network nodes

10.1 General

This section specifies RRC messages that are transferred between network nodes. These RRC messages may be transferred to or from the UE via another Radio Access Technology. Consequently, these messages have similar characteristics as the RRC messages that are transferred across the E-UTRA radio interface, i.e. the same transfer syntax and protocol extension mechanisms apply.

10.2 Inter-node RRC messages

10.2.1 General

This section specifies RRC messages that are sent either across the X2- or the S1-interface, either to or from the eNB, i.e. a single 'logical channel' is used for all RRC messages transferred across network nodes. The information could originate from or be destined for another RAT.

--- EUTRA-InterNodeDefinitions

This ASN.1 segment is the start of the E-UTRA inter-node PDU definitions.

```
-- ASN1START

**HandoverPreparationInformation field descriptions**

### ue-RadioAccessCapabilityInfo
E-UTRA radio access capabilities are always included and in case of inter-RAT handover to E-UTRA, UTRA radio access capabilities may be included. (If UTRA radio access capabilities are received from the source RAN, they are ignored by target eNB.) In case of inter-RAT handover to E-UTRA and the source is GERAN, GERAN capabilities are always included.

### as-Config
The radio resource configuration. Applicable in case of intra-E-UTRA handover. If the target receives an incomplete MeasConfig and RadioResourceConfigDedicated in the as-Config, the target eNB may decide to apply the full configuration option based on the ue-ConfigRelease.

### rrm-Config
Local E-UTRAN context used depending on the target node’s implementation, which is mainly used for the RRM purpose.

### as-Context
Local E-UTRAN context required by the target eNB.

### ue-ConfigRelease
Indicates the RRC protocol release applicable for the current UE configuration. This could be used by target eNB to decide if the full configuration approach should be used. If this field is not present, the target assumes that the current UE configuration is based on the release 8 version of RRC protocol. NOTE 1.

**NOTE 1:** The source typically sets the ue-ConfigRelease to the release corresponding with the current dedicated radio configuration. The source may however also consider the common radio resource configuration e.g. in case interoperability problems would appear if the UE temporarily continues extensions of this part of the configuration in a target cell not supporting them.

3GPP
10.3 Inter-node RRC information element definitions

AS-Config

The AS-Config IE contains information about RRC configuration information in the source cell which can be utilized by target cell to determine the need to change the RRC configuration during the handover preparation phase. The information can also be used after the handover is successfully performed or during the RRC connection re-establishment.

NOTE: The AS-Config re-uses information elements primarily created to cover the radio interface signalling requirements. Consequently, the information elements may include some parameters that are not relevant for the target eNB e.g. the SFN as included in the MasterInformationBlock.
**AS-Config field descriptions**

- **sourceMeasConfig**
  Measurement configuration in the source cell. The measurement configuration for all measurements existing in the source cell when handover is triggered shall be included. See 10.5.

- **sourceRadioResourceConfig**
  Radio configuration in the source cell. The radio resource configuration for all radio bearers existing in the source cell when handover is triggered shall be included. See 10.5.

- **sourceSecurityAlgorithmConfig**
  This field provides the AS integrity protection (SRBs) and AS ciphering (SRBs and DRBs) algorithm configuration used in the source cell.

- **sourceMasterInformationBlock**
  MasterInformationBlock transmitted in the source cell.

- **sourceSystemInformationBlockType1**
  SystemInformationBlockType1 transmitted in the source cell.

- **sourceSystemInformationBlockType2**
  SystemInformationBlockType2 transmitted in the source cell.

- **antennaInfoCommon**
  This field provides information about the number of antenna ports in the source cell.

- **sourceDL-CarrierFreq**
  Provides the parameter Downlink EARFCN in the source cell, see TS 36.101 [42].

- **sourceOtherConfig**
  Provides other configuration in the source cell.

---

**AS-Context**

The IE **AS-Context** is used to transfer local E-UTRAN context required by the target eNB.

---

**AS-Context information element**

```asn
AS-Context ::= SEQUENCE {
    reestablishmentInfo ReestablishmentInfo OPTIONAL -- Cond HO
}
```

---

**AS-Context field descriptions**

- **reestablishmentInfo**
  Including information needed for the RRC connection re-establishment.

<table>
<thead>
<tr>
<th>Conditional presence</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>HO</td>
<td>The field is mandatory present in case of handover within E-UTRA; otherwise the field is not present.</td>
</tr>
</tbody>
</table>

---

**ReestablishmentInfo**

The **ReestablishmentInfo** IE contains information needed for the RRC connection re-establishment.

---

**ReestablishmentInfo information element**

```asn
ReestablishmentInfo ::= SEQUENCE {
    sourcePhysCellId PhysCellId,
    targetCellShortMAC-I ShortMAC-I,
}
```

AdditionalReestabInfoList ::= SEQUENCE { SIZE (1..maxReestabInfo) } OF AdditionalReestabInfo

AdditionalReestabInfo ::= SEQUENCE{
  cellIdentity CellIdentity,
  key-eNodeB-Star Key-eNodeB-Star,
  shortMAC-I ShortMAC-I
}

Key-eNodeB-Star ::= BIT STRING (SIZE (256))

--- ASN1STOP

ReestablishmentInfo field descriptions

sourcePhyCellId
The physical cell identity of the source cell, used to determine the UE context in the target eNB at re-establishment.

targetCellShortMAC-I
The ShortMAC-I for the handover target cell, in order for potential re-establishment to succeed.

additionalReestabInfoList
Contains a list of shortMAC-I and KeNB* for cells under control of the target eNB, required for potential re-establishment by the UE in these cells to succeed.

Key-eNodeB-Star
Parameter KeNB*: See TS 33.401 [32, 7.2.8.4]. This parameter is only used for X2 handover, and for S1 handover, it shall be ignored by target eNB.

---

RRM-Config

The RRM-Config IE contains information about UE specific RRM information before the handover which can be utilized by target eNB after the handover is successfully performed.

RRM-Config information element

--- ASN1START

RRM-Config ::= SEQUENCE {
  ue-InactiveTime ENUMERATED {
    s1, s2, s3, s5, s7, s10, s15, s20, s25, s30, s40, s50, min1, min1s20c, min1s40, min2, min2s30, min3, min3s30, min4, min5, min6, min7, min8, min9, min10, min12, min14, min17, min20, min24, min28, min33, min38, min44, min50, hr1, hr1min30, hr2, hr2min30, hr3, hr3min30, hr4, hr5, hr6, hr8, hr10, hr13, hr16, hr20, day1, day1hr12, day2, day2hr12, day3, day4, day5, day7, day10, day14, day19, day24, day30, dayMoreThan30} OPTIONAL,
}

--- ASN1STOP

RRM-Config field descriptions

ue-InactiveTime
Duration while UE has not received or transmitted any user data. Thus the timer is still running in case e.g., UE measures the neighbour cells for the HO purpose. Value s1 corresponds to 1 second, s2 corresponds to 2 seconds and so on. Value min1 corresponds to 1 minute, value min1s20 corresponds to 1 minute and 20 seconds, value min1s40 corresponds to 1 minute and 40 seconds and so on. Value hr1 corresponds to 1 hour, hr1min30 corresponds to 1 hour and 30 minutes and so on.

---
10.4 Inter-node RRC multiplicity and type constraint values

- Multiplicity and type constraints definitions

```asn1
maxReestabInfo INTEGER ::= 32
   -- Maximum number of KeNB* and shortMAC-I forwarded
   -- at handover for re-establishment preparation
```

- End of EUTRA-InterNodeDefinitions

```asn1
END
```

10.5 Mandatory information in AS-Config

The AS-Config transferred between source eNB and target-eNB shall include all IEs necessary to describe the AS context. The conditional presence in section 6 is only applicable for eNB to UE communication.

The "need" or "cond" statements are not applied in case of sending the IEs from source eNB to target eNB. Some information elements shall be included regardless of the "need" or "cond" e.g. discardTimer. The AS-Config re-uses information elements primarily created to cover the radio interface signalling requirements. The information elements may include some parameters that are not relevant for the target eNB e.g. the SFN as included in the MasterInformationBlock.

Within the sourceRadioResourceConfig the source eNB shall include fields that are optional for eNB to UE communication, if the functionality is configured unless explicitly specified otherwise in the following:

- in accordance with a condition that is explicitly stated to be applicable; or
- a default value is defined for the concerned field; and the configured value is the same as the default value that is defined; or
- the need of the field is OP and the current UE configuration corresponds with the behaviour defined for absence of the field;
For the measurement configuration, a corresponding operation as 5.5.6.1 is executed by target eNB.

Within the `sourceMeasConfig` the source eNB shall include fields that are optional for eNB to UE communication, if the functionality is configured unless explicitly specified otherwise in the following:

- in accordance with a condition that is explicitly stated to be applicable; or
- a default value is defined for the concerned field; and the configured value is the same as the default value that is defined; or

11 UE capability related constraints and performance requirements

11.1 UE capability related constraints

The following table lists constraints regarding the UE capabilities that E-UTRAN is assumed to take into account.
### 11.2 Processing delay requirements for RRC procedures

The UE performance requirements for RRC procedures are specified in the following table, by means of a value \( N \):

\[
N = \text{the number of 1ms subframes from the end of reception of the E-UTRAN -> UE message on the UE physical layer up to when the UE shall be ready for the reception of uplink grant for the UE -> E-UTRAN response message with no access delay other than the TTI-alignment (e.g. excluding delays caused by scheduling, the random access procedure or physical layer synchronisation).}
\]

Annex A (informative):
Guidelines, mainly on use of ASN.1

Editor's note  No agreements have been reached concerning the extension of RRC PDUs so far. Any statements in this section about the protocol extension mechanism should be considered as FFS.

A.1  Introduction

The following clauses contain guidelines for the specification of RRC protocol data units (PDUs) with ASN.1.

A.2  Procedural specification

A.2.1  General principles

The procedural specification provides an overall high level description regarding the UE behaviour in a particular scenario.

It should be noted that most of the UE behaviour associated with the reception of a particular field is covered by the applicable parts of the PDU specification. The procedural specification may also include specific details of the UE behaviour upon reception of a field, but typically this should be done only for cases that are not easy to capture in the PDU section e.g. general actions, more complicated actions depending on the value of multiple fields.

Likewise, the procedural specification need not specify the UE requirements regarding the setting of fields within the messages that are send to E-UTRAN i.e. this may also be covered by the PDU specification.

A.2.2  More detailed aspects

The following more detailed conventions should be used:

- **Bullets:**
  - Capitals should be used in the same manner as in other parts of the procedural text i.e. in most cases no capital applies since the bullets are part of the sentence starting with ‘The UE shall:’
  - All bullets, including the last one in a sub-clause, should end with a semi-colon i.e. an ‘;’
- **Conditions**
  - Whenever multiple conditions apply, a semi-colon should be used at the end of each conditions with the exception of the last one, i.e. as in ‘if cond1; or cond2;’

A.3  PDU specification

A.3.1  General principles

A.3.1.1  ASN.1 sections

The RRC PDU contents are formally and completely described using abstract syntax notation (ASN.1), see X.680 [13], X.681 (02/2002) [14].
The complete ASN.1 code is divided into a number of ASN.1 sections in the specifications. In order to facilitate the extraction of the complete ASN.1 code from the specification, each ASN.1 section begins with a text paragraph consisting entirely of an "ASN.1 start tag", which consists of a double hyphen followed by a single space and the text string "ASN1START" (in all upper case letters). Each ASN.1 section ends with a text paragraph consisting entirely of an "ASN.1 stop tag", which consists of a double hyphen followed by a single space and the text "ASN1STOP" (in all upper case letters):

```
-- ASN1START
-- ASN1STOP
```

The text paragraphs containing the ASN.1 start and stop tags should not contain any ASN.1 code significant for the complete description of the RRC PDU contents. The complete ASN.1 code may be extracted by copying all the text paragraphs between an ASN.1 start tag and the following ASN.1 stop tag in the order they appear, throughout the specification.

NOTE: A typical procedure for extraction of the complete ASN.1 code consists of a first step where the entire RRC PDU contents description (ultimately the entire specification) is saved into a plain text (ASCII) file format, followed by a second step where the actual extraction takes place, based on the occurrence of the ASN.1 start and stop tags.

A.3.1.2 ASN.1 identifier naming conventions

The naming of identifiers (i.e., the ASN.1 field and type identifiers) should be based on the following guidelines:

- Message (PDU) identifiers should be ordinary mixed case without hyphenation. These identifiers, e.g., the RRCCoonectionModificationCommand, should be used for reference in the procedure text. Abbreviated forms of these identifiers should not be used.

- Type identifiers other than PDU identifiers should be ordinary mixed case, with hyphenation used to set off acronyms only where an adjacent letter is a capital, e.g., EstablishmentCause, SelectedPLMN (not Selected-PLMN, since the "d" in "Selected" is lowercase), InitialUE-Identity and MeasSFN-SFN-TimeDifference.

- Field identifiers shall start with a lowercase letter and use mixed case thereafter, e.g., establishmentCause. If a field identifier begins with an acronym (which would normally be in upper case), the entire acronym is lowercase (plmn-Identity, not pLMN-Identity). The acronym is set off with a hyphen (ue-Identity, not ueIdentity), in order to facilitate a consistent search pattern with corresponding type identifiers.

- Identifiers that are likely to be keywords of some language, especially widely used languages, such as C++ or Java, should be avoided to the extent possible.

- Identifiers, other than PDU identifiers, longer than 25 characters should be avoided where possible. It is recommended to use abbreviations, which should be done in a consistent manner i.e. use 'Meas' instead of 'Measurement' for all occurrences. Examples of typical abbreviations are given in table A.3.1.2.1-1 below.

- For future extension: When an extension is introduced a suffix is added to the identifier of the concerned ASN.1 field and/or type. A suffix of the form "-rX" is used, with X indicating the release, for ASN.1 fields or types introduced in a later release (i.e. a release later than the original/first release of the protocol) as well as for ASN.1 fields or types for which a revision is introduced in a later release replacing a previous version, e.g., Foo-r9 for the Rel-9 version of the ASN.1 type Foo. A suffix of the form "-rXYZ" is used for ASN.1 fields or types that only are an extension of a corresponding earlier field or type (see sub-clause A.4), e.g., AnElement-v10b0 for the extension of the ASN.1 type AnElement introduced in version 10.11.0 of the specification. A number 0...9, 10, 11, etc. is used to represent the first part of the version number, indicating the release of the protocol. Lower case letters a, b, c, etc. are used to represent the second (and third) part of the version number if they are greater than 9. In the procedural specification, in field descriptions as well as in headings suffixes are not used, unless there is a clear need to distinguish the extension from the original field.

- More generally, in case there is a need to distinguish different variants of an ASN.1 field or IE, a suffix should be added at the end of the identifiers e.g. MeasObjectUTRAN, ConfigCommon. When there is no particular need to distinguish the fields (e.g. because the field is included in different IEs), a common field identifier name may be used. This may be attractive e.g. in case the procedural specification is the same for the different variants.

NOTE: The table A.3.1.2.1-1 is not exhaustive. Additional abbreviations may be used in ASN.1 identifiers when needed.

A.3.1.3 Text references using ASN.1 identifiers

A text reference into the RRC PDU contents description from other parts of the specification is made using the ASN.1 field or type identifier of the referenced element. The ASN.1 field and type identifiers used in text references should be in the italic font style. The "do not check spelling and grammar" attribute in Word should be set. Quotation marks (i.e., "") should not be used around the ASN.1 field or type identifier.

A reference to an RRC PDU type should be made using the corresponding ASN.1 type identifier followed by the word "message", e.g., a reference to the RRCConnectionRelease message.

A reference to a specific part of an RRC PDU, or to a specific part of any other ASN.1 type, should be made using the corresponding ASN.1 field identifier followed by the word "field", e.g., a reference to the prioritisedBitRate field in the example below.

```asn1
LogicalChannelConfig ::= SEQUENCE {
    ul-SpecificParameters SEQUENCE {
        priority
        prioritisedBitRate
        bucketSizeDuration
        logicalChannelGroup
        OPTIONAL
    }
} OPTIONAL
```

NOTE: All the ASN.1 start tags in the ASN.1 sections, used as examples in this annex to the specification, are deliberately distorted, in order not to include them when the ASN.1 description of the RRC PDU contents is extracted from the specification.

A reference to a specific type of information element should be made using the corresponding ASN.1 type identifier preceded by the acronym "IE", e.g., a reference to the IE LogicalChannelConfig in the example above.

References to a specific type of information element should only be used when those are generic, i.e., without regard to the particular context wherein the specific type of information element is used. If the reference is related to a particular context, e.g., an RRC PDU type (message) wherein the information element is used, the corresponding field identifier in that context should be used in the text reference.
A reference to a specific value of an ASN.1 field should be made using the corresponding ASN.1 value while using quotation marks (i.e., " ") around the ASN.1 value, e.g., "if the status field is set to value "true"."

### A.3.2 High-level message structure

Within each logical channel type, the associated RRC PDU (message) types are alternatives within a CHOICE, as shown in the example below.

```asn1
-- /example/ ASN1START

DL-DCCCH-Message ::= SEQUENCE {
    message   DL-DCCCH-MessageType
}

DL-DCCCH-MessageType ::= CHOICE {
    c1       CHOICE {
        dlInformationTransfer   DLInformationTransfer,
        handoverFromEUTRAPreparationRequest  HandoverFromEUTRAPreparationRequest,
        mobilityFromEUTRACommand  MobilityFromEUTRACommand,
        rrcConnectionReconfiguration  RRCConnectionReconfiguration,
        rrcConnectionRelease  RRCConnectionRelease,
        securityModeCommand  SecurityModeCommand,
        ueCapabilityEnquiry  UECapabilityEnquiry,
        spare1 NULL
    },
    messageClassExtension  SEQUENCE {}
}

-- ASN1STOP
```

A nested two-level CHOICE structure is used, where the alternative PDU types are alternatives within the inner level c1 CHOICE.

Spare alternatives (i.e., spare1 in this case) may be included within the c1 CHOICE to facilitate future extension. The number of such spare alternatives should not extend the total number of alternatives beyond an integer-power-of-two number of alternatives (i.e., eight in this case).

Further extension of the number of alternative PDU types is facilitated using the messageClassExtension alternative in the outer level CHOICE.

### A.3.3 Message definition

Each PDU (message) type is specified in an ASN.1 section similar to the one shown in the example below.

```asn1
-- /example/ ASN1START

RRCConnectionReconfiguration ::= SEQUENCE {
    rrc-TransactionIdentifier  RRC-TransactionIdentifier,
    criticalExtensions  CHOICE {
        c1  CHOICE{
            rrcConnectionReconfiguration-r8  RRCConnectionReconfiguration-r8-IEs,
            spare3 NULL, spare2 NULL, spare1 NULL
        },
        criticalExtensionsFuture  SEQUENCE {}
    }
}

RRCConnectionReconfiguration-r8-IEs ::= SEQUENCE {
    -- Enter the IEs here.
    ...
}

-- ASN1STOP
```

Hooks for critical and non-critical extension should normally be included in the PDU type specification. How these hooks are used is further described in sub-clause A.4.

Critical extensions are characterised by a redefinition of the PDU contents and need to be governed by a mechanism for protocol version agreement between the encoder and the decoder of the PDU, such that the encoder is prevented from sending a critically extended version of the PDU type, which is not comprehended by the decoder.
Critical extension of a PDU type is facilitated by a two-level CHOICE structure, where the alternative PDU contents are alternatives within the inner level c1 CHOICE. Spare alternatives (i.e., spare3 down to spare1 in this case) may be included within the c1 CHOICE. The number of spare alternatives to be included in the original PDU specification should be decided case by case, based on the expected rate of critical extension in the future releases of the protocol.

Further critical extension, when the spare alternatives from the original specifications are used up, is facilitated using the criticalExtensionsFuture in the outer level CHOICE.

In PDU types where critical extension is not expected in the future releases of the protocol, the inner level c1 CHOICE and the spare alternatives may be excluded, as shown in the example below.

```asn1
RRCConnectionReconfigurationComplete ::= SEQUENCE {
  rrc-TransactionIdentifier RRC-TransactionIdentifier,
  criticalExtensions CHOICE {
    rrcConnectionReconfigurationComplete-r8
      RRCConnectionReconfigurationComplete-r8-IEs,
      criticalExtensionsFuture SEQUENCE {}
  }
}
```

Non-critical extensions are characterised by the addition of new information to the original specification of the PDU type. If not comprehended, a non-critical extension may be skipped by the decoder, whilst the decoder is still able to complete the decoding of the comprehended parts of the PDU contents.

Non-critical extensions at locations other than the end of the message or other than at the end of a field contained in a BIT or OCTET STRING are facilitated by use of the ASN.1 extension marker "...". The original specification of a PDU type should normally include the extension marker at the end of the sequence of information elements contained.

Non-critical extensions at the end of the message or at the end of a field that is contained in a BIT or OCTET STRING are facilitated by use of an empty sequence that is marked OPTIONAL e.g. as shown in the following example:

```asn1
RRCMessage-r8-IEs ::= SEQUENCE {
  field1 InformationElement1,
  field2 InformationElement2,
  noncriticalExtension SEQUENCE {} OPTIONAL -- Need OP
}
```

The ASN.1 section specifying the contents of a PDU type may be followed by a field description table where a further description of, e.g., the semantic properties of the fields may be included. The general format of this table is shown in the example below. The field description table is absent in case there are no fields for which further description needs to be provided e.g. because the PDU does not include any fields, or because an IE is defined for each field while there is nothing specific regarding the use of this IE that needs to be specified.

<table>
<thead>
<tr>
<th>%PDU-TypeIdentifier% field descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>%field identifier% Field description.</td>
</tr>
<tr>
<td>%field identifier% Field description.</td>
</tr>
</tbody>
</table>

The field description table has one column. The header row shall contain the ASN.1 type identifier of the PDU type.

The following rows are used to provide field descriptions. Each row shall include a first paragraph with a field identifier (in bold and italic font style) referring to the part of the PDU to which it applies. The following paragraphs at the same
row may include (in regular font style), e.g., semantic description, references to other specifications and/ or specification of value units, which are relevant for the particular part of the PDU.

The parts of the PDU contents that do not require a field description shall be omitted from the field description table.

### A.3.4 Information elements

Each IE (information element) type is specified in an ASN.1 section similar to the one shown in the example below.

```-- example/ ASN1START
PRACH-ConfigSIB ::= SEQUENCE {
   rootSequenceIndex INTEGER (0..1023),
   prach-ConfigInfo PRACH-ConfigInfo
}

PRACH-Config ::= SEQUENCE {
   rootSequenceIndex INTEGER (0..1023),
   prach-ConfigInfo PRACH-ConfigInfo OPTIONAL -- Need ON
}

PRACH-ConfigInfo ::= SEQUENCE {
   prach-ConfigIndex ENUMERATED {ffs},
   highSpeedFlag ENUMERATED {ffs},
   zeroCorrelationZoneConfig ENUMERATED {ffs}
}
-- ASN1STOP
```

IEs should be introduced whenever there are multiple fields for which the same set of values apply. IEs may also be defined for other reasons e.g. to break down a ASN.1 definition in to smaller pieces.

A group of closely related IE type definitions, like the IEs PRACH-ConfigSIB and PRACH-Config in this example, are preferably placed together in a common ASN.1 section. The IE type identifiers should in this case have a common base, defined as the generic type identifier. It may be complemented by a suffix to distinguish the different variants. The "PRACH-Config" is the generic type identifier in this example, and the "SIB" suffix is added to distinguish the variant. The sub-clause heading and generic references to a group of closely related IEs defined in this way should use the generic type identifier.

The same principle should apply if a new version, or an extension version, of an existing IE is created for critical or non-critical extension of the protocol (see sub-clause A.4). The new version, or the extension version, of the IE is included in the same ASN.1 section defining the original. A suffix is added to the type identifier, using the naming conventions defined in sub-clause A.3.1.2, indicating the release or version of the where the new version, or extension version, was introduced.

Local IE type definitions, like the IE PRACH-ConfigInfo in the example above, may be included in the ASN.1 section and be referenced in the other IE types defined in the same ASN.1 section. The use of locally defined IE types should be encouraged, as a tool to break up large and complex IE type definitions. It can improve the readability of the code. There may also be a benefit for the software implementation of the protocol end-points, as these IE types are typically provided by the ASN.1 compiler as independent data elements, to be used in the software implementation.

An IE type defined in a local context, like the IE PRACH-ConfigInfo, should not be referenced directly from other ASN.1 sections in the RRC specification. An IE type which is referenced in more than one ASN.1 section should be defined in a separate sub-clause, with a separate heading and a separate ASN.1 section (possibly as one in a set of closely related IE types, like the IEs PRACH-ConfigSIB and PRACH-Config in the example above). Such IE types are also referred to as 'global IEs'.

**NOTE:** Referring to an IE type, that is defined as a local IE type in the context of another ASN.1 section, does not generate an ASN.1 compilation error. Nevertheless, using a locally defined IE type in that way makes the IE type definition difficult to find, as it would not be visible at an outline level of the specification. It should be avoided.

The ASN.1 section specifying the contents of one or more IE types, like in the example above, may be followed by a field description table, where a further description of, e.g., the semantic properties of the fields of the information elements may be included. This table may be absent, similar as indicated in sub-clause A.3.3 for the specification of the
PDU type. The general format of the field description table is the same as shown in sub-clause A.3.3 for the specification of the PDU type.

A.3.5 Fields with optional presence

A field with optional presence may be declared with the keyword DEFAULT. It identifies a default value to be assumed, if the sender does not include a value for that field in the encoding:

```asn1
PreambleInfo ::= SEQUENCE {
  numberOfRA-Preambles INTEGER (1..64) DEFAULT 1,
  ...
}
```

Alternatively, a field with optional presence may be declared with the keyword OPTIONAL. It identifies a field for which a value can be omitted. The omission carries semantics, which is different from any normal value of the field:

```asn1
PRACH-Config ::= SEQUENCE {
  rootSequenceIndex INTEGER (0..1023),
  prach-ConfigInfo PRACH-ConfigInfo OPTIONAL -- Need ON
}
```

The semantics of an optionally present field, in the case it is omitted, should be indicated at the end of the paragraph including the keyword OPTIONAL, using a short comment text with a need statement. The need statement includes the keyword "Need", followed by one of the predefined semantics tags (OP, ON or OR) defined in sub-clause 6.1. If the semantics tag OP is used, the semantics of the absent field are further specified either in the field description table following the ASN.1 section, or in procedure text.

A.3.6 Fields with conditional presence

A field with conditional presence is declared with the keyword OPTIONAL. In addition, a short comment text shall be included at the end of the paragraph including the keyword OPTIONAL. The comment text includes the keyword "Cond", followed by a condition tag associated with the field ("UL" in this example):

```asn1
LogicalChannelConfig ::= SEQUENCE {
  ul-SpecificParameters SEQUENCE {
    priority INTEGER (0),
    ...
  } OPTIONAL -- Cond UL
}
```

When conditionally present fields are included in an ASN.1 section, the field description table after the ASN.1 section shall be followed by a conditional presence table. The conditional presence table specifies the conditions for including the fields with conditional presence in the particular ASN.1 section.

<table>
<thead>
<tr>
<th>Conditional presence</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>UL</td>
<td>Specification of the conditions for including the field associated with the condition tag = &quot;UL&quot;. Semantics in case of optional presence under certain conditions may also be specified.</td>
</tr>
</tbody>
</table>

The conditional presence table has two columns. The first column (heading: "Conditional presence") contains the condition tag (in italic font style), which links the fields with a condition tag in the ASN.1 section to an entry in the table. The second column (heading: "Explanation") contains a text specification of the conditions and requirements for
the presence of the field. The second column may also include semantics, in case of an optional presence of the field, under certain conditions i.e. using the same predefined tags as defined for optional fields in A.3.5.

Conditional presence should primarily be used when presence of a field depends on the presence and/or value of other fields within the same message. If the presence of a field depends on whether another feature/function has been configured, while this function can be configured independently e.g. by another message and/or at another point in time, the relation is best reflected by means of a statement in the field description table.

If the ASN.1 section does not include any fields with conditional presence, the conditional presence table shall not be included.

Whenever a field is only applicable in specific cases e.g. TDD, use of conditional presence should be considered.

**A.3.7 Guidelines on use of lists with elements of SEQUENCE type**

Where an information element has the form of a list (the SEQUENCE OF construct in ASN.1) with the type of the list elements being a SEQUENCE data type, an information element shall be defined for the list elements even if it would not otherwise be needed.

For example, a list of PLMN identities with reservation flags is defined as in the following example:

```asciidoc
--- /example/ ASN1START
PLMN-IdentityInfoList ::= SEQUENCE (SIZE (1..6)) OF PLMN-IdentityInfo
PLMN-IdentityInfo ::= SEQUENCE {
    plmn-Identity,P LMN-Identity,  
    cellReservedForOperatorUse ENUMERATED {reserved, notReserved}
}
--- ASN1STOP
```

rather than as in the following (bad) example, which may cause generated code to contain types with unpredictable names:

```asciidoc
--- /bad example/ ASN1START
PLMN-IdentityList ::= SEQUENCE (SIZE (1..6)) OF SEQUENCE {
    plmn-Identity,  
    cellReservedForOperatorUse ENUMERATED {reserved, notReserved}
}
--- ASN1STOP
```

**A.4 Extension of the PDU specifications**

**A.4.1 General principles to ensure compatibility**

It is essential that extension of the protocol does not affect interoperability i.e. it is essential that implementations based on different versions of the RRC protocol are able to interoperate. In particular, this requirement applies for the following kind of protocol extensions:

- Introduction of new PDU types (i.e. these should not cause unexpected behaviour or damage).
- Introduction of additional fields in an extensible PDUs (i.e. it should be possible to ignore uncomprehended extensions without affecting the handling of the other parts of the message).
- Introduction of additional values of an extensible field of PDUs. If used, the behaviour upon reception of an uncomprehended value should be defined.

It should be noted that the PDU extension mechanism may depend on the logical channel used to transfer the message e.g. for some PDUs an implementation may be aware of the protocol version of the peer in which case selective ignoring of extensions may not be required.
The non-critical extension mechanism is the primary mechanism for introducing protocol extensions i.e. the critical extension mechanism is used merely when there is a need to introduce a 'clean' message version. Such a need appears when the last message version includes a large number of non-critical extensions, which results in issues like readability, overhead associated with the extension markers. The critical extension mechanism may also be considered when it is complicated to accommodate the extensions by means of non-critical extension mechanisms.

### A.4.2 Critical extension of messages

The mechanisms to critically extend a message are defined in A.3.3. There are both "outer branch" and "inner branch" mechanisms available. The "outer branch" consists of a CHOICE having the name criticalExtensions, with two values, c1 and criticalExtensionsFuture. The criticalExtensionsFuture branch consists of an empty SEQUENCE, while the c1 branch contains the “inner branch” mechanism.

The "inner branch" structure is a CHOICE with values of the form "MessageName-rX-IEs" (e.g., "RRCConnectionReconfiguration-r8-IEs") or "spareX", with the spare values having type NULL. The "-rX-IEs" structures contain the complete structure of the message IEs for the appropriate release; i.e., the critical extension branch for the Rel-10 version of a message includes all Rel-8 and Rel-9 fields (that are not obviated in the later version), rather than containing only the additional Rel-10 fields.

The following guidelines may be used when deciding which mechanism to introduce for a particular message, i.e. only an 'outer branch', or an 'outer branch' in combination with an 'inner branch' including a certain number of spares:

- For certain messages, e.g. initial uplink messages, messages transmitted on a broadcast channel, critical extension may not be applicable.
- An outer branch may be sufficient for messages not including any fields.
- The number of spares within inner branch should reflect the likelihood that the message will be critically extended in future releases (since each release with a critical extension for the message consumes one of the spare values). The estimation of the critical extension likelihood may be based on the number, size and changeability of the fields included in the message.
- In messages where an inner branch extension mechanism is available, all spare values of the inner branch should be used before any critical extensions are added using the outer branch.

The following example illustrates the use of the critical extension mechanism by showing the ASN.1 of the original and of a later release.

--- /example/ ASN1START -- Original release

```asn1
RRCMessage ::= SEQUENCE {
  rrc-TransactionIdentifier RRC-TransactionIdentifier,
  criticalExtensions CHOICE {
    c1 CHOICE{
      rrcMessage-r8 RRCMessage-r8-IEs,
      spare3 NULL, spare2 NULL, spare1 NULL
    },
    criticalExtensionsFuture SEQUENCE {}
  }
}
```

--- /example/ ASN1STOP

--- /example/ ASN1START -- Later release

```asn1
RRCMessage ::= SEQUENCE {
  rrc-TransactionIdentifier RRC-TransactionIdentifier,
  criticalExtensions CHOICE {
    c1 CHOICE{
      rrcMessage-r8 RRCMessage-r8-IEs,
      rrcMessage-r10 RRCMessage-r10-IEs,
      rrcMessage-r11 RRCMessage-r11-IEs,
      rrcMessage-r14 RRCMessage-r14-IEs
    },
    later CHOICE {
      c2 CHOICE{
        rrcMessage-r16 RRCMessage-r16-IEs,
        spare7 NULL, spare6 NULL, spare5 NULL, spare4 NULL
      }
    }
  }
}
```

--- /example/ ASN1STOP

---
A.4.3 Non-critical extension of messages

A.4.3.1 General principles

The mechanisms to extend a message in a non-critical manner are defined in A.3.3. W.r.t. the use of extension markers, the following additional guidelines apply:

- When further non-critical extensions are added to a message that has been critically extended, the inclusion of these non-critical extensions in earlier critical branches of the message should be avoided when possible.
- The extension marker ("…") is the primary non-critical extension mechanism that is used unless a length determinant is not required. Examples of cases where a length determinant is not required:
  - at the end of a message,
  - at the end of a structure contained in a BIT STRING or OCTET STRING
- When an extension marker is available, non-critical extensions are preferably placed at the location (e.g. the IE) where the concerned parameter belongs from a logical/functional perspective (referred to as the 'default extension location')
  - It is desirable to aggregate extensions of the same release or version of the specification into a group, which should be placed at the lowest possible level.
  - In specific cases it may be preferable to place extensions elsewhere (referred to as the 'actual extension location') e.g. when it is possible to aggregate several extensions in a group. In such a case, the group should be placed at the lowest suitable level in the message. <TBD: ref to separate example>
  - In case placement at the default extension location affects earlier critical branches of the message, locating the extension at a following higher level in the message should be considered.
  - In case an extension is not placed at the default extension location, an IE should be defined. The IE's ASN.1 definition should be placed in the same ASN.1 section as the default extension location. In case there are intermediate levels in-between the actual and the default extension location, an IE may be defined for each level. Intermediate levels are primarily introduced for readability and overview. Hence intermediate levels need not always be introduced e.g. they may not be needed when the default and the actual extension location are within the same ASN.1 section. <TBD: ref to separate example>

A.4.3.2 Further guidelines

Further to the general principles defined in the previous section, the following additional guidelines apply regarding the use of extension markers:

- Extension markers within SEQUENCE
  - Extension markers are primarily, but not exclusively, introduced at the higher nesting levels
  - Extension markers are introduced for a SEQUENCE comprising several fields as well as for information elements whose extension would result in complex structures without it (e.g. re-introducing another list)
  - Extension markers are introduced to make it possible to maintain important information structures e.g. parameters relevant for one particular RAT
  - Extension markers are also used for size critical messages (i.e. messages on BCCH, PCCH and CCCH), although introduced somewhat more carefully
The extension fields introduced (or frozen) in a specific version of the specification are grouped together using double brackets.

Extension markers within ENUMERATED

- Spare values are used until the number of values reaches the next power of 2, while the extension marker caters for extension beyond that limit
- A suffix of the form "vXYZ" is used for the identifier of each new value, e.g. "value-vXYZ".

Extension markers within CHOICE:

- Extension markers are introduced when extension is foreseen and when comprehension is not required by the receiver i.e. behaviour is defined for the case where the receiver cannot comprehend the extended value (e.g. ignoring an optional CHOICE field). It should be noted that defining the behaviour of a receiver upon receiving a not comprehended choice value is not required if the sender is aware whether or not the receiver supports the extended value.
- A suffix of the form "vXYZ" is used for the identifier of each new choice value, e.g. "choice-vXYZ".

Non-critical extensions at the end of a message/ of a field contained in an OCTET or BIT STRING:

- When a nonCriticalExtension is actually used, a "Need" statement is not provided for the field, which always is a group including at least one extension and a field facilitating further possible extensions.

Further, more general, guidelines:

- In case a need statement is not provided for a group, a "Need" statement is provided for all individual extension fields within the group i.e. including for fields that are not marked as OPTIONAL. The latter is to clarify the action upon absence of the whole group.

A.4.3.3 Typical example of evolution of IE with local extensions

The following example illustrates the use of the extension marker for a number of elementary cases (sequence, enumerated, choice). The example also illustrates how the IE may be revised in case the critical extension mechanism is used.

NOTE In case there is a need to support further extensions of release n while the ASN.1 of release (n+1) has been frozen, without requiring the release n receiver to support decoding of release (n+1) extensions, more advanced mechanisms are needed e.g. including multiple extension markers.

```asn1
-- /example/ ASN1START

InformationElement1 ::= SEQUENCE {
    field1 ENUMERATED {
        value1, value2, value3, value4-v880,
        ..., value5-v960 },
    field2 CHOICE {
        field2a BOOLEAN,
        field2b InformationElement2b,
        ..., field2c-v960
    },
    ..., [
        field3-r9 InformationElement3-r9 OPTIONAL -- Need OR
    ],
    [ field3-v9a0 InformationElement3-v9a0 OPTIONAL, -- Need OR
      field4-r9 InformationElement4 OPTIONAL -- Need OR
    ]
}

InformationElement1-r10 ::= SEQUENCE {
    field1 ENUMERATED {
        value1, value2, value3, value4-v880,
        value5-v960, value6-v1170, spare2, spare1, ... },
    field2 CHOICE {
        field2a BOOLEAN,
        field2b InformationElement2b,
        field2c-v960 InformationElement2c-r9,
        ..., };

-- /example/ ASN1END
```
Some remarks regarding the extensions of InformationElement1 as shown in the above example:

- The InformationElement1 is initially extended with a number of non-critical extensions. In release 10 however, a critical extension is introduced for the message using this IE. Consequently, a new version of the IE InformationElement1 (i.e. InformationElement1-r10) is defined in which the earlier non-critical extensions are incorporated by means of a revision of the original field.

- The value4-v880 is replacing a spare value defined in the original protocol version for field1. Likewise value6-v1170 replaces spare3 that was originally defined in the r10 version of field1.

- Within the critically extended release 10 version of InformationElement1, the names of the original fields/IEs are not changed, unless there is a real need to distinguish them from other fields/IEs. E.g. the field1 and InformationElement4 were defined in the original protocol version (release 8) and hence not re-tagged. Moreover, the field3-r9 is introduced in release 9 and not re-tagged; although, the InformationElement3 is also critically extended and therefore tagged InformationElement3-r10 in the release 10 version of InformationElement1.

A.4.3.4 Typical examples of non critical extension at the end of a message

The following example illustrates the use of non-critical extensions at the end of the message or at the end of a field that is contained in a BIT or OCTET STRING i.e. when an empty sequence is used.

Some remarks regarding the extensions shown in the above example:

- The InformationElement4 is introduced in the original version of the protocol (release 8) and hence no suffix is used.

A.4.3.5 Examples of non-critical extensions not placed at the default extension location

The following example illustrates the use of non-critical extensions in case an extension is not placed at the default extension location.
ParentIE-WithEM

The IE ParentIE-WithEM is an example of a high level IE including the extension marker (EM). The root encoding of this IE includes two lower level IEs ChildIE1-WithoutEM and ChildIE2-WithoutEM which not include the extension marker. Consequently, non-critical extensions of the Child-IEs have to be included at the level of the Parent-IE.

The example illustrates how the two extension IEs ChildIE1-WithoutEM-vNx0 and ChildIE2-WithoutEM-vNx0 (both in release N) are used to connect non-critical extensions with a default extension location in the lower level IEs to the actual extension location in this IE.

ParentIE-WithEM information element

```asn1
ParentIE-WithEM ::= SEQUENCE {
    -- Root encoding, including:
    childIE1-WithoutEM   ChildIE1-WithoutEM OPTIONAL,  -- Need ON
    childIE2-WithoutEM   ChildIE2-WithoutEM OPTIONAL,  -- Need ON
    .
    .
    .
    [ [ childIE1-WithoutEM-vNx0 ChildIE1-WithoutEM-vNx0 OPTIONAL,  -- Need ON
         childIE2-WithoutEM-vNx0 ChildIE2-WithoutEM-vNx0 OPTIONAL -- Need ON
    ] ]
}
```

Some remarks regarding the extensions shown in the above example:

- The fields childIEx-WithoutEM-vNx0 may not really need to be optional (depends on what is defined at the next lower level).
- In general, especially when there are several nesting levels, fields should be marked as optional only when there is a clear reason.

ChildIE1-WithoutEM

The IE ChildIE1-WithoutEM is an example of a lower level IE, used to control certain radio configurations including a configurable feature which can be setup or released using the local IE ChildIE1-ConfigurableFeature. The example illustrates how the new field chIE1-NewField is added in release N to the configuration of the configurable feature. The example is based on the following assumptions:

- when initially configuring as well as when modifying the new field, the original fields of the configurable feature have to be provided also i.e. as if the extended ones were present within the setup branch of this feature.
- when the configurable feature is released, the new field should be released also.
- when omitting the original fields of the configurable feature the UE continues using the existing values (which is used to optimise the signalling for features that typically continue unchanged upon handover).
- when omitting the new field of the configurable feature the UE releases the existing values and discontinues the associated functionality (which may be used to support release of unsupported functionality upon handover to an eNB supporting an earlier protocol version).

The above assumptions, which affect the use of conditions and need codes, may not always apply. Hence, the example should not be re-used blindly.

ChildIE1-WithoutEM information elements

```asn1
ChildIE1-WithoutEM ::= SEQUENCE {
    -- Root encoding, including:
    chIE1-ConfigurableFeature ChIE1-ConfigurableFeature OPTIONAL  -- Need ON
}
```
ChildIE1-WithoutEM-vNx0 ::= SEQUENCE {
  chIE1-ConfigurableFeature-vNx0  ChIE1-ConfigurableFeature-vNx0 OPTIONAL -- Cond ConfigF
}

ChildIE1-ConfigurableFeature ::= CHOICE {
  release NULL,
  setup SEQUENCE {
    -- Root encoding
  }
}

ChildIE1-ConfigurableFeature-vNx0 ::= SEQUENCE {
  chIE1-NewField-rN INTEGER (0..31)
} -- ASN1STOP

<table>

<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConfigF</td>
<td>The field is optional present, need OR, in case of chIE1-ConfigurableFeature is included and set to &quot;setup&quot;; otherwise the field is not present and the UE shall delete any existing value for this field.</td>
</tr>
</tbody>
</table>

---

ChildIE2-WithoutEM

The IE ChildIE2-WithoutEM is an example of a lower level IE, typically used to control certain radio configurations. The example illustrates how the new field chIE1-NewField is added in release N to the configuration of the configurable feature.

A.5 Guidelines regarding inclusion of transaction identifiers in RRC messages

The following rules provide guidance on which messages should include a Transaction identifier:

1. DL messages on CCCH that move UE to RRC-Idle should not include the RRC transaction identifier.
2. All network initiated DL messages by default should include the RRC transaction identifier.
3. All UL messages that are direct response to a DL message with an RRC Transaction identifier should include the RRC Transaction identifier.
4. All UL messages that require a direct DL response message should include an RRC transaction identifier.
5: All UL messages that are not in response to a DL message nor require a corresponding response from the network should not include the RRC Transaction identifier.

A.6 Protection of RRC messages (informative)

The following list provides information which messages can be sent (unprotected) prior to security activation and which messages can be sent unprotected after security activation.

P… Messages that can be sent (unprotected) prior to security activation

A - I… Messages that can be sent without integrity protection after security activation

A - C… Messages that can be sent unciphered after security activation

NA… Message can never be sent after security activation

A.7 Miscellaneous

The following miscellaneous conventions should be used:

- References: Whenever another specification is referenced, the specification number and optionally the relevant subclause, table or figure, should be indicated in addition to the pointer to the References section e.g. as follows: 'see TS 36.212 [22, 5.3.3.1.6].

Annex B (normative): Release 8 AS feature handling

B.1 Feature group indicators

This annex contains the definitions of the bits in field featureGroupIndicators.

In this release of the protocol, the UE shall include the field featureGroupIndicators in the IE UE-EUTRA-Capability. For a specific indicator, if all functionalities for a feature group listed in Table B.1-1 have been implemented and tested, the UE shall set the indicator as one (1), else (i.e. if any one of the functionalities in a feature group listed in Table B.1-1, which have not been implemented or tested), the UE shall set the indicator as zero (0).

The UE shall set all indicators, which do not have a definition in the table B.1-1, as zero.

If the optional field featureGroupIndicators is not included by UE supporting future release, the network may assume that UE supports all features listed in Table B.1-1 and deployed in the network.

|31 | Undefined                                                                                   |
Clarification for mobility from EUTRAN and inter-frequency handover within EUTRAN

There are several feature groups related to mobility from E-UTRAN and inter-frequency handover within EUTRAN. The description of these features is based on the assumption that we have 5 main "functions" related to mobility from E-UTRAN:

A. Support of measurements and cell reselection procedure in idle mode
B. Support of RRC release with redirection procedure in connected mode
C. Support of Network Assisted Cell Change in connected mode
D. Support of measurements and reporting in connected mode
E. Support of handover procedure in connected mode

All functions can be applied for mobility to Inter-frequency to EUTRAN, GERAN, UTRAN, CDMA2000 HRPD and CDMA2000 1xRTT except for function C) which is only applicable for mobility to GERAN. Table B.1-2 below summarises the mobility functions that are supported based on the UE capability signaling (band support) and the setting of the feature group support indicators.

### Table B.1-2: Mobility from E-UTRAN

<table>
<thead>
<tr>
<th>Feature</th>
<th>GERAN</th>
<th>UTRAN</th>
<th>HRPD</th>
<th>1xRTT</th>
<th>EUTRAN</th>
</tr>
</thead>
<tbody>
<tr>
<td>A. Measurements and cell reselection procedure in E-UTRA idle mode</td>
<td>Supported if GERAN band support is indicated</td>
<td>Supported if UTRAN band support is indicated</td>
<td>Supported if CDMA2000 HRPD band support is indicated</td>
<td>Supported if CDMA2000 1xRTT band support is indicated</td>

<tr>
<td>D. Inter-frequency/RAT measurements, reporting and measurement reporting event B2 (for inter-RAT) in E-UTRA connected mode</td>
<td>Group 23</td>
<td>Group 22</td>
<td>Group 26</td>
<td>Group 24</td>
<td>Group 25</td>
</tr>
<tr>
<td>E. Inter-frequency/RAT handover procedure in E-UTRA connected mode</td>
<td>Group 9 (GSM_connected handover) or Group 27 (SRVCC handover)</td>
<td>Group 8 (PS handover)</td>
<td>Group 12</td>
<td>Group 11</td>
<td>Group 13</td>
</tr>
</tbody>
</table>

In case measurements and reporting function is not supported by UE, the network may still issue the mobility procedures redirection (B) and CCO (C) in a blind fashion.

### B.2 CSG support

In this release of the protocol, it is mandatory for the UE to support a minimum set of CSG functionality consisting of:

- Identifying whether a cell is CSG or not;
- Ignoring CSG cells in cell selection/reselection.
Additional CSG functionality in AS, i.e. the requirement to detect and camp on CSG cells when the “CSG whitelist” is available or when manual CSG selection is triggered by the user, are related to the corresponding NAS features. This additional AS functionality consists of:

- Manual CSG selection;
- Autonomous CSG search;
- Implicit priority handling for cell reselection with CSG cells.

It is possible that this additional CSG functionality in AS is not supported or tested in early UE implementations.

Note that since the above AS features relate to idle mode operations, the capability support is not signalled to the network. For these reasons, no “feature group indicator” is assigned to this feature to indicate early support in Rel-8.
